### 1.0 INTRODUCTION

Golder Associates, Inc. (Golder) has prepared this report on behalf of Luminant Generation Company LLC (Luminant) to satisfy annual groundwater monitoring and corrective action reporting requirements of the Coal Combustion Residuals (CCR) Rule for the Permanent Disposal Pond 5 (PDP 5) at the Martin Lake Steam Electric Station (MLSES) in Rusk County, Texas. The CCR unit and CCR monitoring well network are shown on Figure 1.

The CCR Rule (40 CFR 257 Subpart D - Standards for the Receipt of Coal Combustion Residuals in Landfills and Surface Impoundments) has been promulgated by the United States Environmental Protection Agency (USEPA) to regulate the management and disposal of CCRs as solid waste under Resource Conservation and Recovery Act (RCRA) Subtitle D. For existing CCR landfills and surface impoundments, the CCR Rule requires that the owner or operator prepare an annual groundwater monitoring and corrective action report to document the status of the groundwater monitoring and corrective action program for the CCR unit for the previous calendar year. Per 40 CFR 257.90(e) of the CCR Rule, the report should contain the following information, to the extent available:

- (1) A map, aerial image, or diagram showing the CCR unit and all background (or upgradient) and downgradient monitoring wells, to include the well identification numbers, that are part of the groundwater monitoring program for the CCR unit;
- (2) Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a narrative description of why those actions were taken;
- (3) In addition to all the monitoring data obtained under §§ 257.90 through 257.98, a summary including the number of groundwater samples that were collected for analysis for each background and downgradient well, the dates the samples were collected, and whether the sample was required by the detection monitoring or assessment monitoring programs;
- (4) A narrative discussion of any transition between monitoring programs (e.g., the date and circumstances for transitioning from detection monitoring to assessment monitoring in addition to identifying the constituent(s) detected at a statistically significant increase over background levels); and
- (5) Other information required to be included in the annual report as specified in §§ 257.90 through 257.98.

### 2.0 MONITORING AND CORRECTIVE ACTION PROGRAM STATUS

The PDP 5 CCR Unit is currently in the Detection Monitoring Program. Golder collected the initial Detection Monitoring Program groundwater samples from the PDP 5 CCR monitoring well network in September 2017. Subsequent Detection Monitoring Program groundwater samples were collected on a semi-annual basis in 2018 and 2019. The evaluation of the data was completed using procedures described in the Statistical Analysis Plan (PBW, 2017) to identify statistically significant increases (SSIs) of Appendix III parameters over background concentrations. The Detection Monitoring Program sampling dates and parameters are summarized in the following table:

### **Detection Monitoring Program Summary**

Sampling Dates	Parameters	SSIs	Assessment Monitoring			
Sampling Dates	Farameters	3315	Program Established			
September 2017			No			
February 2018 (re-samples)	Appendix III	Yes	(Alternate Source			
rebluary 2016 (le-samples)			Demonstration Completed)			
June 2018			No			
September 2018	Appendix III	Yes	(Alternate Source			
November 2018 (re-samples)			Demonstration Completed)			
May 2019			TBD			
November 2019	Appendix III	Yes	(Alternate Source Being			
November 2019			Assessed)			

The statistical background values and Appendix III analytical data are presented in Tables 1 and 2, respectively. SSIs of Appendix III parameters were identified for the 2017 and 2018 sampling events. An initial Alternate Source Demonstration was completed in 2018, which indicated that a source other than the CCR unit caused the SSIs observed in the 2017 sample data and 2018 re-sample data. A subsequent Alternate Source Demonstration was completed in 2019 based on the 2018 sample data. As such, PDP 5 has remained in the Detection Monitoring Program. A summary of the 2019 Alternate Source Demonstration is presented in Attachment 1.

Detection Monitoring Program groundwater samples were collected from the CCR groundwater monitoring network on a semi-annual basis in 2019, as required by the CCR Rule. The first 2019 semi-annual Detection Monitoring Program sampling event was conducted in May 2019. The second 2019 semi-annual Detection Monitoring Program sampling event was conducted in November 2019. The analytical data from the 2019 semi-annual Detection Monitoring Program sampling events were evaluated using procedures described in the Statistical Analysis Plan to identify SSIs of Appendix III parameters over background concentrations. SSIs of

Appendix III parameters over background concentrations were identified for several constituents for which SSIs had previously been attributed to alternate sources. Alternate sources for the SSIs identified in the 2019 sample data are being evaluated in accordance with 40 CFR § 257.94. If an alternate source is not identified to be the cause of the SSI, an Assessment Monitoring Program will be established in accordance with 40 CFR § 257.94(e)(2).

### 3.0 KEY ACTIONS COMPLETED IN 2019

Semi-annual Detection Monitoring Program groundwater monitoring events were completed in May and November 2019. The number of groundwater samples that were collected for analysis for each background and downgradient well, the dates the samples were collected, and the analytical results for the groundwater samples are summarized in Table 2. A map showing the CCR units and monitoring wells is provided as Figure 1.

No CCR wells were installed or decommissioned in 2019.

# 4.0 PROBLEMS ENCOUNTERED AND ACTIONS TO RESOLVE THE PROBLEMS

No problems were encountered with the CCR groundwater monitoring program in 2019.

### 5.0 KEY ACTIVITIES PLANNED FOR 2020

The following key activities are planned for 2020:

- Continue the Detection Monitoring Program in accordance with 40 CFR § 257.94.
- Complete evaluation of Appendix III analytical data and compare results to statistical background values to determine whether an SSI has occurred.
- If an SSI is identified, potential alternate sources (i.e., a source other than the CCR unit caused the SSI or that the SSI resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality) will be evaluated. If an alternate source is identified to be the cause of the SSI, a written demonstration will be completed within 90 days of SSI determination and included in the Annual Groundwater Monitoring and Corrective Action Report.
- If an alternate source is not identified to be the cause of the SSI, an Assessment Monitoring Program will be established in accordance with 40 CFR § 257.94(e)(2).

## ATTACHMENT 1 ALTERNATE SOURCE DEMONSTRATION

Alternate Source Demonstration April 10, 2019

# ALTERNATE SOURCE DEMONSTRATION SUMMARY MARTIN LAKE STEAM ELECTRIC STATION – PDP 5

#### Introduction

This Alternative Source Demonstration Summary was prepared to document that a source other than the Permanent Disposal Pond 5 (PDP 5) (the Site) caused the statistically significant increases (SSIs) over background levels observed during the 2018 Detection Monitoring Program sampling events as required by 40 CFR 257.94(e)(2). A detailed Site plan of the Coal Combustion Residual (CCR) groundwater monitoring network is shown on Figure 1. The Detection Monitoring Program groundwater data are summarized in Table 1.

### 2018 Semi-Annual Detection Monitoring Results and Discussion

Detection Monitoring Program groundwater samples were collected on a semi-annual basis from the Site CCR monitoring well network in 2018 in accordance with 40 CFR 257.94. Golder collected the initial 2018 Detection Monitoring Program groundwater samples in June 2018 and the second semi-annual Detection Monitoring Program groundwater samples in September 2018. In accordance with procedures described in the Statistical Analysis Plan (PBW, 2017), several verification re-samples were collected in November 2018 to verify the September 2018 sample results. Based on the semi-annual and re-sample results, SSIs were identified for boron in wells PDP-23 and PDP-25 during the second semi-annual and November 2018 re-sampling events. Additional potential SSIs were identified for other wells and Appendix III constituents (boron, calcium and chloride) during the second 2018 semi-annual sampling event; however, all verification sample results for these wells and constituents were below prediction limits. Therefore, in accordance with procedures outlined in the Statistical Analysis Plan, SSIs are not indicated for these wells and constituents.

The boron concentrations in wells PDP-23 and PDP-25 (maximum sample concentrations of 0.076 and 0.167 mg/L, respectively) are significantly lower than the boron concentrations observed at other Site wells where SSIs were not observed. For example, six of the seven other CCR monitoring wells (MW-17A, MW-18A, MW-19, MW-20A, PDP-22, and PDP-24) have had Detection Monitoring Program boron sample concentrations that were higher than those observed in the PDP-23 and PDP-25 SSI samples. As such, the boron sample concentrations observed at PDP-23 and PDP-25 are similar or less than those observed in other Site wells, and could be attributed to variability caused by the heterogeneity of the uppermost aguifer at the Site.

PDP 5 is built on top of three closed and capped landfills (PDP 1, PDP 2, and PDP 3). PDP 4, which is located adjacent to PDP 5 to the south, is also a closed and capped landfill. PDP 1 through PDP 4 are not considered regulated units under the CCR Rule. In addition to the natural variability caused by the heterogeneity of the groundwater system at the Site, sample concentrations identified as SSIs may also be attributed to potential historical effects to groundwater caused by the closed landfills in the vicinity of PDP 5.

#### Conclusion

SSIs were identified for boron during the 2018 Detection Monitoring Program sampling events at PDP 5. All observed SSIs are attributed to natural variation in groundwater quality due to the heterogeneity of the groundwater system and to potential effects from the closed landfills in the vicinity of PDP 5 (PDP 1 through PDP 4), and are not considered evidence of a release from the CCR unit. In accordance with Section 257.94(e)(2), Luminant should continue the Detection Monitoring Program. Initiation of an Assessment Monitoring Program is not required at this time.
