## TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

**Log In Number:** Loc: 140 **15376**

| Review Items | Yes | No | NA | If No, what was the problem? |
|---|---|---|---|---|
| 1. Are the shipping containers intact? | ✓ | | | ☐ **Containers, Broken** |
| 2. Were ambient air containers received intact? | | | ✓ | ☐ Checked in lab |
| 3. The coolers/containers custody seal if present, is it intact? | ✓ | | | ☐ Yes<br>☐ NA |
| 4. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)<br>Thermometer ID : VC68<br>Correction factor: Ta.2 | ✓ | | | ☐ **Cooler Out of Temp, Client Contacted, Proceed/Cancel**<br>☐ **Cooler Out of Temp, Same Day Receipt** |
| 5. Were all of the sample containers received intact? | ✓ | | | ☐ **Containers, Broken** |
| 6. Were samples received in appropriate containers? | ✓ | | | ☐ **Containers, Improper; Client Contacted; Proceed/Cancel** |
| 7. Do sample container labels match COC? (IDs, Dates, Times) | ✓ | | | ☐ **COC & Samples Do Not Match**<br>☐ **COC Incorrect/Incomplete**<br>☐ **COC Not Received** |
| 8. Were all of the samples listed on the COC received? | ✓ | | | ☐ **Sample Received, Not on COC**<br>☐ **Sample on COC, Not Received** |
| 9. Is the date/time of sample collection noted? | ✓ | | | ☐ **COC; No Date/Time; Client Contacted** |
| 10. Was the sampler identified on the COC? | ✓ | | | ☐ **Sampler Not Listed on COC** |
| 11. Is the client and project name/# identified? | ✓ | | | ☐ **COC Incorrect/Incomplete** |
| 12. Are tests/parameters listed for each sample? | ✓ | | | ☐ **COC No tests on COC** |
| 13. Is the matrix of the samples noted? | ✓ | | | ☐ **COC Incorrect/Incomplete** |
| 14. Was COC relinquished? (Signed/Dated/Timed) | ✓ | | | ☐ **COC Incorrect/Incomplete** |
| 15. Were samples received within holding time? | ✓ | | | ☐ **Holding Time - Receipt** |
| 16. Were samples received with correct chemical preservative (excluding Encore)? | | | ✓ | ☐ **pH Adjusted, pH Included (See box 16A)**<br>☐ **Incorrect Preservative** |
| 17. Were VOA samples received without headspace? | | | ✓ | ☐ **Headspace (VOA only)** |
| 18. Did you check for residual chlorine, if necessary? (e.g. 1613B, 1668)<br>Chlorine test strip lot number: | | | ✓ | ☐ **Residual Chlorine** |
| 19. For 1613B water samples is pH<9? | | | ✓ | ☐ If no, notify lab to adjust |
| 20. For rad samples was sample activity info. Provided? | | | ✓ | ☐ Project missing info |

## Groundwater Sample Collection

GOLDER

| | | | | | | |
|---|---|---|---|---|---|---|
| Project/Phase | 19116549/19122262 | Equipment Decon | ☒ Dedicated equipment | Depth to Water | 16.82 | ft. BMP |
| Site Location | OGSES | | ☐ Decon between locations | Casing Stickup | — | ft. |
| Date | 5-6-20 | Reference Point | ☒ Top of casing | ☐ Depth to Water | 16.82 | ft. BGL |
| MW ID | FGD-14 | Location | Other | Total MW Depth | | ft. BGL |
| Sample ID | FGD-14 | Water Quality | | MW Diameter | 2.0 | inches |
| Pump | ☐ Waterra ☐ Submersible | Meter Model | YSI - HORIBA | MW Volume | | gallons |
| | ☒ Peristaltic ☐ Bladder | Unit Number | U-50 | Pump Intake Depth | | ft. BGL |

**Standard volume capacity of monitoring wells:** Schedule 40 PVC (1-inch OD, 0.04 gallons/foot; 2-inch OD, 0.16 gallons/foot; 4-inch OD, 0.65 gallons/foot)

| Time | Purge Rate (L/min) | Cumulative Purge Volume (L) | Depth to Water (ft) | Temp (°C) ☐ NM | pH ☐ NM | Conductivity (µS/m or mS/cm) ☐ not measured | Dissolved Oxygen (mg/L) ☐ not measured | Redox Potential (mV) ☐ not measured | Turbidity (NTU) ☐ NM |
|---|---|---|---|---|---|---|---|---|---|
| 1436 | | | | | | | | | |
| 1447 | .2 | / | 17.14 | 21.7 | 6.81 | 1320 | 2.34 | 26 | 7.6 |
| 1451 | ↓ | / | 17.17 | 21.9 | 6.86 | 1360 | 1.94 | 27 | 6.3 |
| 1456 | ↓ | / | 17.18 | 21.9 | 6.87 | 1350 | 1.93 | 27 | 6.7 |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |

Purging was completed based on: ☒ stabilization of water quality parameters ☐ removal of three well volumes ☐ removal of at least one half well volume (low yield well)

| Bottles Collected | | | | Filtration (10µm / 45µm) | Preserved (type) | Notes and Observations (quality control sample, other) |
|---|---|---|---|---|---|---|
| Time | Volume | Composition (G / P) | No. | | | |
| 1505 | 1L | P | 2 | ☐ filtered ☒ unfiltered | HNO3 | MNA |
| | | | | ☐ filtered ☐ unfiltered | | |

**Notes:** record time at which purging is started. For low flow sampling, recommended stabilization criteria: temp ± 0.5°C; pH ± 0.1 units; conductivity ± 3%; DO ± 1 mg/L; ORP ± 10 mV; for at least three successive measurements that are made every 3-5 minutes with <1 foot of stable draw down.

Unless otherwise noted, groundwater sample collection was completed in accordance with the applicable requirements of Golder's Quality Assurance Program and Standard Operating Procedure ☐ 9 Conventional Groundwater Sample Collection ☒ 10 Low Flow Groundwater Sample Collection.

| | | | | | | | | | |
| | | | | | | | | | |

Purging was completed based on: ☒ stabilization of water quality parameters ☐ removal of three well volumes ☐ removal of at least one half well volume (low yield well)

| Bottles Collected | | | | Filtration | Preserved | Notes and Observations |
|---|---|---|---|---|---|---|
| Time | Volume | Composition (G / P) | No. | (10µm / 45µm) | (type) | (quality control sample, other) |
| 1110 | 250mL | P | 2 | ☐ filtered ☒ unfiltered | NONE, HNO3 | CCS |
| 1110 | 250mL | P | 2 | ☐ filtered ☒ unfiltered | NONE, HNO3 | MNA |

**Notes:** record time at which purging is started. For low flow sampling, recommended stabilization criteria: temp ± 0.5°C; pH ± 0.1 units; conductivity ± 3%; DO ± 1 mg/L; ORP ± 10 mV; for at least three successive measurements that are made every 3-5 minutes with <1 foot of stable draw down.

Unless otherwise noted, groundwater sample collection was completed in accordance with the applicable requirements of Golder's Quality Assurance Program and Standard Operating Procedure ☐ 9 Conventional Groundwater Sample Collection ☒ 10 Low Flow Groundwater Sample Collection.

# Open House

## Regarding Oak Grove Power Plant Groundwater Quality

Under a 2015 U.S. EPA rule, Oak Grove Management Company LLC has been monitoring groundwater quality near the Oak Grove Power Plant ash storage site.

The company is hosting an open house for the public to learn more about the groundwater testing, the results, and mitigation options.

The informational open house is a come-and-go event, and provides attendees with an opportunity to ask questions. There will not be a formal presentation.

**OPEN HOUSE**

Date: Tuesday, Oct. 29, 2019
Time: 6 to 7:30 p.m.
Location: The Pridgeon Center
351 Cooks Ln., Franklin, TX 77856

Oak Grove Power Plant
Oak Grove Management Company LLC

**Hearne Eagles (4-3) (2-1) vs. Thorndale Bulldogs (6-2) (3-1) on Friday, October 25 at 7:30 p.m. in Thorndale**

# Time to whelp the Bulldogs

**MICHAEL COTTON**
Sports Editor
Robertson County News

Noland Harper | Robertson County News
Charles Cooks takes down the Milano Eagle with help from Jalen Sauls-Lewis and Damian Dunn.

It's put up or shut up time for the Hearne Eagles as they enter this Friday's showdown against the Thorndale Bulldogs. Both teams have only one loss on their resume and that was to district leading Holland.

Thorndale lost to Holland 40-13 while the Eagles lost to them 34-19. Their only other common opponent was the Milano Eagles. Both defeated the Eagles handily so that game is really no gauge.

The best comparison is the Holland contest. Hearne had many opportunities to defeat Holland and was in the game until the very end. A late Holland score sealed the win whereas, the Bulldogs were never in the game against Holland.

Thorndale will rely on a strong junior varsity from last season and 13 returning starters. All purpose player Jagger Rubio leads the team but he has help in a big offensive line and fellow running back Michael Herzog.

Their offense has been explosive at times scoring 60+ three times and 36 points in their other two victories. Only Holland has managed to score more than 20 points against the Bulldog defense. Hearne will have their work cut out on both sides of the ball.

The Eagles are coming off their best defensive performance of the year before the bye week. They limited Milano to a single field goal and just 28 total yards. They will need that kind of effort against the Bulldogs offense if they are to win. On offense it will just take consistency.

Quarterback Micah Smith has demonstrated he is one of the top quarterback prospects in the state. He has a big arm and is an accurate passer. In addition he has shown himself to be a better than average runner making him a dual threat at the position. He has a load of talented receivers in wideouts Jalen Gonzales, Damian Dunn, and Jabari Dunn and tight end Tyquez Tindle.

The Eagles have not run the ball as well as Coach Sargent would have liked but Quinston Owens, Alijah Miles, and Dunn give the Eagles threats at the position. It will all come down to how consistent on offense can the Eagles be when they have the ball.

Coach Sargent knows a lot is on the line this game and rest assured he will have the Eagles ready to play.

It is our time Eagles let's take advantage of the opportunity.

**Calvert Trojans (4-3) vs. Oglesby Tigers (1-5-1) on Friday October 25 at 7:30 p.m. in Oglesby**

# Trojans determined to cage the Tigers

Suzi Elliott | Robertson County News
Calvert Trojans keeping their teammate guarded from the three BVCHEA players attempting to take possession of the ball.

**MICHAEL COTTON**
Sports Editor
Robertson County News

It was good to play at home for the Calvert Trojans after being on the road for five of their first six games. It was a strong schedule against some state ranked opponents and it was what Coach Ashley wanted for his team. Learning to play good teams on the road is important come playoff time because their are no home playoff games and no patsies to play.

Another reason it was important for Coach Ashley and the Trojans is because there is such limited competition within the district. None of the three teams in district are expected to give the Trojans much of a fight beginning with this weeks opponent the Oglesby Tigers.

The Tigers are 1-5-1 on the season and have been mercy ruled three times. They have shown an ability to score points having never been shut out this season.

Spread back Ian Markum, a junior, is the leader of the offense. He accounted for over 1500 yards last season and is the key that sparks the Tigers offense. Running back Isaac Uribe and all around athlete Travis Bass will provide help on the offensive side of the ball.

Whether they can move the ball against Calvert will be a big question. The Trojans have not allowed more than 36 points in any game this season despite the loaded schedule.

However, it will be on defense that the Tigers will get their true test having given up 98 points in a game doesn't look real promising against a potent Calvert offense.

It was their final tune-up before district season starts and the Calvert Trojans looked prime for a playoff run, especially on defense, as they disposed of Brazos Valley Homeschool 45-0.

The Trojans defense owned the night as they scored a touchdown, recovered 3 fumbles, intercepted 3 passes, and held BVCHEA to a total offense of 30 yards. You could see it would be the defense's night, when after the offense turned the ball over on downs on it's first drive, linebacker David Williams intercepted a pass and rambled 14 yards for the first score of the night on the very next play.

The defense would give the offense the ball

Open House
Regarding Oak Grove Power Plant Groundwater Quality

Under a 2015 U.S. EPA rule, Oak Grove Management Company LLC has been monitoring groundwater quality near the Oak Grove Power Plant ash storage site.

The company is hosting an open house for the public to learn more about the groundwater testing, the results, and mitigation options.

The informational open house is a come-and-go event, and provides attendees with an opportunity to ask questions. There will not be a formal presentation.

OPEN HOUSE

Date: Tuesday, Oct. 29, 2019
Time: 6 to 7:30 p.m.
Location: The Pridgeon Center
351 Cooks Ln., Franklin, TX 77856

Appendix B Tier II and Tier III Monitored Natural Attenuation Evaluation

Appendix C Tier IV Monitored Natural Attenuation Performance Monitoring Plan

# 1.0 INTRODUCTION

On behalf of Oak Grove Management Company (Luminant), Golder Associates Inc. (Golder), Member of WSP, has prepared this Remedy Selection Report for FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") at the Oak Grove Steam Electric Station (OGSES) in Robertson County, Texas (hereafter, the "Site") (**Figure 1**). Luminant manages coal combustion residuals (CCR) generated from the OGSES in the FGD Ponds per the applicable requirements of 40 C.F.R. Part 257, Subpart D as amended (CCR Final Rule) and 30 TAC Chapter 352 (Texas CCR Rule). The United States Environmental Protection Agency (USEPA) published its final approval of the Texas CCR rule on June 28, 2021. *See* 86 Fed. Reg. 33,892 (June 28, 2021). The Texas CCR Rule became effective on July 28, 2021, and it adopts and incorporates by reference the requirements for remedy selection located at § 257.97.

Statistically significant levels (SSLs) of cobalt and lithium above groundwater protection standards (GWPSs) were detected in the uppermost aquifer hydraulically downgradient of the FGD Ponds during 2018 assessment monitoring. In response to the 2018 cobalt and lithium SSLs, an Assessment of Corrective Measures (ACM) report was completed for the FGD Ponds in September 2019 as required by § 257.96 (Golder 2019a). The ACM demonstrated that groundwater concentrations of cobalt and lithium were stable or decreasing at all wells and the extent of cobalt and lithium SSLs was delineated on-site (i.e., no offsite migration was indicated). The ACM evaluated various source control and groundwater response technologies to address the cobalt and lithium SSLs. An Alternate Source Demonstration (ASD) was completed in accordance with § 257.95(g)(3)(ii) in October 2020 (Golder 2020), which indicated that a source other than the FGD Ponds caused the lithium SSL. Lithium has therefore been eliminated as a constituent of concern at the FGD Ponds. The ACM was updated in May 2021 (Golder 2021a) to remove lithium from the list of constituents evaluated in the ACM. In addition, updated statistical analyses for cobalt that incorporated assessment monitoring data collected from 2019 to 2021 indicate that cobalt is also no longer present at SSLs above the GWPS; however, for the purposes of the ACM and remedy selection, Luminant continued to evaluate potential groundwater remedies for cobalt based on the 2018 SSL to address potential cobalt SSLs that may occur in the future.

The purpose of this selection of remedy report is to describe the selected remedy, describe how the selected remedy meets the requirements of §257.97, and provide a schedule for implementing and completing remedial activities.

# 2.0 SITE SETTING

The OGSES is located approximately 10 miles north of the city of Franklin in Robertson County, Texas. Construction of the OGSES began in the mid-1980s; however, plant construction was suspended in the mid-1980s prior to completion. OGSES construction resumed in 2007 and the plant was commissioned in 2010. The OGSES is expected to remain in operation for the foreseeable future, depending on future power demands. The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (**Figure 1**).

FGD-A construction began in the mid-1980s, but pond construction stopped when construction of the OGSES was suspended (Golder 2016a). FGD-A construction resumed in 2007 and was completed in 2008. FGD-A covers an area of approximately 9 acres and stores CCR and other wastes generated from the OGSES prior to recycling or disposal in OGSES Ash Landfill 1. FGD-A is lined with a 3-foot thick compacted clay liner. FGD-A was removed from service prior to April 2021 and Luminant anticipates retrofit completion in 2022 with a composite liner system meeting the requirements of § 257.71(a)(1)(ii) of the CCR Rule. The retrofitted liner system will consist of a minimum 2-foot thick compacted clay liner or geosynthetic clay liner (GCL), overlain by a

60-mil HDPE geomembrane liner. The floor of the pond will be covered by a 1.5-foot thick layer of protective soil and the upper portion of the pond side slopes will be covered with concrete revetment mat.

Construction began on the FGD-B Pond in the mid-1980s during the initial OGSES construction phase for use as a storm water retention pond. Pond construction was halted in the 1980s when construction of the OGSES was suspended. The former retention pond was reconstructed in 2012 as FGD-B Pond for use in management of CCR and other wastes (Golder 2016b). FGD-B covers an area of approximately 11.2 acres and receives CCR and other wastes generated from the OGSES. FGD-B is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner, overlain by a 1-foot thick layer of protective soil (Golder 2016a). The composite liner system in FGD-B complies with the requirements of §257.71(a)(1)(ii) of the CCR Rule.

FGD-C Pond construction commenced in 2015 and was completed in 2016 (Golder 2016b). FGD-C Pond is approximately 15.2 acres in size and receives CCR and other wastes generated from the OGSES. FGD-C is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner, overlain by a 2-foot thick soil/ash protective layer (Golder 2016b). The composite liner system in FGD-C complies with the requirements of §257.71(a)(1)(ii) of the CCR Rule.

## 2.1 Site Hydrogeology and CCR Monitoring Well Network

The Site is located in the outcrop area of the Eocene-aged Wilcox Group (Barnes 1970), which is divided into three formations in the region: the Calvert Bluff, Simsboro, and Hooper Formations (in order from youngest to oldest). The FGD Ponds are completed in the Calvert Bluff Formation, which consists of unconsolidated to moderately consolidated clay and silt, with various amounts of interbedded sand and lignite.

Based on soil borings completed at the Site, the geology near the FGD Ponds generally consists of an upper zone of relatively thick, interbedded sand and clay strata underlain by a lower zone of interbedded silty to clayey sand and well sorted sand (PBW 2017). The uppermost groundwater-bearing unit (GWBU) occurs under unconfined conditions within the shallow interbedded sand units of the Calvert Bluff Formation. Groundwater elevations have generally been highest southeast of the FGD Ponds and relatively flat in the vicinity of the FGD Ponds. Since CCR monitoring began in 2015, the inferred groundwater flow direction at the Site has been to the east-northeast toward Twin Oak Reservoir, which borders the FGD Pond area to the north and east. The CCR groundwater monitoring well network at the FGD Ponds was established in 2015 using Site monitoring wells screened in the uppermost GWBU (FGD-1, FGD-2, FGD-3, FGD-4, FGD-5, FGD-6, FGD-8, FGD-11, and FGD-12). A map of the CCR groundwater monitoring network is provided on **Figure 1**.

Golder performed a survey of water supply wells located in the vicinity of the FGD Ponds in May 2019 as part of a Texas Commission on Environmental Quality (TCEQ) Texas Risk Reduction Program (TRRP) assessment of the Site. A Drinking Water Survey Report (Golder, 2019b) documenting the water well survey activities and findings was approved by the TCEQ in a letter dated August 12, 2019. No imminent threats to water wells or potentially affected drinking water wells were identified.

# 3.0 SOURCE CONTROL MEASURES

FGD-B and FGD-C are constructed with composite liner systems that comply with the requirements of §257.71(a)(1)(ii) of the CCR Rule and these ponds are considered lined surface impoundments under the Rule. Since the liner systems in these ponds comply with the CCR Rule, FGD-B and FGD-C provide an appropriate level of source control as currently constructed and no modifications are necessary to these ponds.

FGD-A is constructed with a clay liner and the pond is considered an unlined surface impoundment under the CCR Rule. As a result, Luminant anticipates completing the retrofit of FGD-A in 2022 with a composite liner system meeting the requirements of § 257.71(a)(1)(ii) of the CCR Rule. The retrofitted liner system will consist of a minimum 2-foot thick compacted clay liner or geosynthetic clay liner (GCL), overlain by a 60-mil HDPE geomembrane liner. The floor of the pond will be covered by a 1.5-foot thick layer of protective soil and the upper portion of the pond side slopes will be covered with concrete revetment mat. Retrofitting FGD-A with a new composite liner system will serve as the source control component of the potential corrective measures for the FGD Ponds.

## 4.0 POTENTIAL GROUNDWATER CORRECTIVE MEASURES

The ACM Report (Golder, 2019a), which assessed potential corrective measures, was prepared to comply with the requirements of CCR Rule § 257.96. A public meeting was held on October 29, 2019 at the Pridgeon Center in Franklin, Texas to discuss the results of the ACM in accordance with § 257.96(e). In accordance with the applicable screening criteria described in §257.96(c), potential corrective measures were evaluated based on their overall performance, reliability, ease of implementation, potential impacts of the remedy, time to begin and complete the remedy, and institutional requirements. The source control measures discussed in Section 3 are considered a component of each of the corrective measures that were evaluated. Possible corrective measures for groundwater included the following options to address groundwater impacts:

- Monitored Natural Attenuation (MNA);
- Groundwater Extraction and Treatment;
- Vertical Hydraulic Barrier;
- Permeable Reactive Barrier;
- In-situ chemical treatment; and
- Phytoremediation

MNA was identified as the most applicable groundwater remedy for further evaluation.

## 5.0 CCR RULE REMEDY OBJECTIVES

In accordance with §257.97(a), based on the results of the ACM, as soon as feasible a remedy should be selected for the CCR Units. Per the regulations, the remedy must prevent further releases, remediate any releases, and restore the affected area to original conditions. Specifically, under § 257.97(b) the remedy must (1) protect human health and the environment; (2) attain the groundwater protection standard as specified pursuant to § 257.95(h); (3) control the sources of releases so as to reduce or eliminate, to the maximum extent feasible, further releases of constituents in appendix IV into the environment; (4) remove from the environment as much of the contaminated material that was released from the CCR unit as is feasible, taking into account factors such as avoiding inappropriate disturbance of sensitive ecosystems; and (5) comply with any relevant standards for management of wastes as specified in § 257.98(d). The CCR Rule also specifies decision criteria to be considered by the owner or operator in selecting the most appropriate remedy. Under § 257.97(c), these criteria include: (1) Long- and short-term effectiveness and protectiveness of the potential remedy(s), along with the degree of certainty that the remedy will prove successful; (2) effectiveness of remedy in controlling the source to reduce further releases; (3) ease or difficulty of implementation; and (4) community concerns.

# 6.0 REMEDY SELECTION

MNA with source control measures has been selected as the remedy to address cobalt concentrations observed at SSLs. This remedy was selected over the other potential corrective measure alternatives based on its overall high performance, high reliability, ease of implementation, low potential for negative impacts, and minimal institutional requirements.

MNA refers to the reliance on natural attenuation processes (within the context of a carefully controlled and monitored approach) to achieve site-specific groundwater remediation objectives. MNA relies on a range of natural processes, including sorption, (co)precipitation, radioactive decay, dispersion, dilution, and abiotic degradation/transformation to achieve remediation objectives. MNA has been demonstrated effective in reducing cobalt concentrations in groundwater by way of cobalt being removed through adsorption to iron hydroxides and/or amorphous metals and the level of effectiveness is dependent on iron hydroxide availability as well as pH, alkalinity, and calcium levels (USEPA 2007a; ITRC 2010).

A Site-specific feasibility study to evaluate MNA as a potential groundwater remedy for the 2018 cobalt SSL at the FGD Ponds was performed in accordance with guidance and best practices promulgated by the USEPA (USEPA 2007a and 2007b) and ITRC (ITRC 2010). The overall feasibility of MNA as a groundwater response technology was evaluated based on the following multi-tiered approach:

1) Demonstrate active constituent removal from groundwater and dissolved plume stability (Tier I);

2) Determine the mechanisms and rates of the operative attenuation processes (Tier II);

3) Determine the long-term capacity for attenuation and the stability of immobilized constituents (Tier III); and

4) Prepare a long-term MNA performance monitoring plan (Tier IV).

A Tier I MNA evaluation report was completed in December 2019 (Golder 2019c) and a Tier II/III MNA evaluation report was completed in June 2021 (Golder 2021b). Based on the results of these MNA evaluations, the following was concluded regarding cobalt:

- Physical and chemical attenuation of cobalt is occurring at the Site. Cobalt levels are stable and the aquifer has adequate capacity to attenuate cobalt in a reasonable timeframe. Modeling indicates that cobalt attenuation will be efficient and stable in the long term. Cobalt in the CCR unit porewater is well below the level that is observed in groundwater, including when a periodic exceedance occurs in downgradient groundwater. Therefore, MNA would be effective in remediating cobalt in groundwater beneath and downgradient of the FGD Ponds.

Copies of the Tier I and Tier II/III MNA evaluation reports are provided in **Appendix A and B**, respectively.

The selected remedy will attain the objectives stated in §257.97 as outlined below:

**(1) <u>Long and short term effectiveness, and degree of certainty of success:</u>**

The Tier I through Tier III MNA studies completed for the Site demonstrate that physical and chemical attenuation of cobalt is occurring, that cobalt concentrations are stable, and that the aquifer has adequate capacity to attenuate cobalt in a reasonable timeframe.

*(i)* *Magnitude of reduction of existing risks*:

Source control measures are likely effective at preventing future releases, and MNA feasibility data indicate that conditions are suitable for the ongoing reduction in cobalt concentrations in groundwater to concentrations below GWPSs.

*(ii)* *Magnitude of residual risks in terms of likelihood of further releases due to CCR remaining following implementation of a remedy*:

Source control measures reduce the risk of future impacts by preventing the transport of CCR constituents to groundwater at concentrations above GWPSs.

*(iii)* *The type and degree of long-term management required, including monitoring, operation, and maintenance*:

Long-term assessment of the condition of monitoring network will be required. Maintenance of the monitoring network is anticipated to be low.

*(iv)* *Short-term risks that might be posed to the community or the environment during implementation of such a remedy, including potential threats to human health and the environment associated with excavation, transportation, and redisposal of contaminant*:

The remedy presents minimal risk of exposure. Results from the ACM nature and extent investigation indicate that Appendix IV constituents at SSLs were contained within the plant property boundary. The Drinking Water Survey Report (Golder, 2019b) indicated the CCR units pose no imminent threats to water supply wells.

*(v)* *Time until full protection is achieved*:

MNA generally requires relatively long periods of time to attenuate cobalt present at SSLs. However, cobalt is not currently present above SSLs.

*(vi)* *Potential for exposure of humans and environmental receptors to remaining wastes, considering the potential threat to human health and the environment associated with excavation, transportation, re-disposal, or containment*:

The selected remedy presents a low risk of exposure. Access to the CCR units and surrounding land are controlled by Luminant. Potential exposure to CCR will be prevented through source control measures and Site access restrictions.

*(vii)* *Long-term reliability of the engineering and institutional controls*:

Restriction of access and exposure are currently implemented and will continue. Site wells to be used in the monitoring network are secured with locks.

*(viii)* *Potential need for replacement of the remedy*:

Although unlikely, monitoring wells may need to be replaced over the monitoring period. Monitoring well replacement will be documented in the Annual Groundwater Monitoring and Corrective Action Report following well replacement activities.

**(2) Effectiveness of remedy in controlling the source to reduce further releases:**

Source control measures are being implemented as discussed in Section 3.0. Source control will reduce infiltration of surface water from the CCR ponds to the GWBU, preventing potential releases to the GWBU.

*(i)* *The extent to which containment practices will reduce further releases*:

Source control measures are likely effective at preventing future releases, and MNA feasibility data indicate that conditions are suitable for the ongoing reduction of cobalt concentrations in groundwater.

(ii) *The extent to which treatment technologies may be used*:

MNA feasibility data indicate that conditions are suitable for the ongoing reduction of cobalt concentrations in groundwater. Additional treatment technologies are not proposed.

**(3) Ease or difficulty of implementation:**

MNA is relatively easily implemented. The existing monitoring well network can be used for the monitoring component of the remedy. Source control measures described in Section 3.0 involve significant cost; however, these measures are being implemented to bring the FGD Ponds into compliance with §257.71(a)(1)(ii). The source control measures will also provide long-term stability to groundwater conditions and ensure long-term effectiveness of MNA as a remedy.

(i) *Degree of difficulty associated with constructing the technology*:

The current monitoring well network will be used to evaluate the effectiveness of the remedy. If required, additional monitoring wells can be installed relatively easily.

(ii) *Expected operational reliability of the technologies*:

There are no anticipated problems with the monitoring network or source control measures.

(iii) *Need to coordinate with and obtain necessary approvals and permits from other agencies*:

The monitoring well network is already in place at the Site. There is no anticipated need to coordinate with and obtain approvals and permits from other agencies.

(iv) *Availability of necessary equipment and specialists*:

Consulting and engineering firms are established that can implement the remedy. Drilling companies and drilling equipment are available in the event that additional wells need to be installed.

(v) *Available capacity and location of needed treatment, storage, and disposal services*:

Adequate treatment, storage, and disposal services are available at the plant or at offsite waste management facilities.

**(4) Community concerns:**

A public meeting was held on October 29, 2019 at the Pridgeon Center in Franklin, Texas to discuss the results of the ACM in accordance with § 257.96(e). No comments were received from the public. As indicated in Section 2.1, there are no nearby water supply wells completed within the GWBU below or downgradient of the FGD Ponds. The ACM (Golder 2019a) demonstrated that groundwater concentrations of cobalt were stable or decreasing at all wells and the extent of the cobalt SSLs was delineated on-site (i.e., no offsite migration was indicated).

# 7.0 SCHEDULE

Routine groundwater monitoring as part of an MNA program is required to verify that MNA is occurring. A Tier IV MNA Performance Monitoring Plan (Golder 2021c) has been prepared to describe the monitoring network, sampling and analysis methods, procedures for assessing MNA effectiveness, and reporting for an MNA program, if one is to be established at the Site. A copy of the Tier IV MNA Performance Monitoring Plan is provided in **Appendix C**. The MNA program could be implemented upon completion of the source control measures described in Section 3.0. However, as discussed previously, cobalt is not currently present at SSLs at the FGD Ponds; therefore, implementation of an MNA program or other remedy option is not currently necessary. Cobalt concentrations in groundwater will continue to be monitored in accordance with the CCR rule to confirm that cobalt concentrations remain below the GWPS. An MNA program will be implemented to address cobalt SSLs of SSLs for other constituents if they are identified in future.

# OAK GROVE MONITORED NATURAL ATTENUATION EVALUATION

## 1.0 OVERVIEW

Groundwater and solid materials were evaluated to determine the feasibility of Monitored Natural Attenuation (MNA) as part of the Assessment of Corrective Measures (ACM) on behalf of Oak Grove Management Company LLC (Luminant) for FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") located at the Oak Grove Steam Electric Station (OGSES) in the FGD Pond area, in Robertson County, Texas. The structure of this feasibility evaluation closely follows the United States Environmental Protection Agency (USEPA) guidance on using MNA as a remedial strategy (USEPA 2007a and 2007b) and considers best practices from the Interstate Technology Regulatory Council (ITRC) document: "A Decision Framework for Applying Monitored Natural Attenuation Processes to Metals and Radionuclides in Groundwater" (ITRC 2010).

Based on the evaluation presented in this document, cobalt and lithium are candidates for MNA at the OGSES FGD Pond area per 40 Code of Federal Regulations (CFR) Part 257 as amended (CCR Final Rule). Both constituents are subject to attenuation controls on their concentrations in downgradient groundwater and meet the initial screening criteria as part of this attenuation assessment. Further geochemical evaluation (i.e. Tier II) of MNA with institutional controls is, therefore, recommended if a future Statistically Significant Level (SSL) of either constituent is identified in groundwater.

## 2.0 APPROACH

To assess the feasibility of MNA at the OGSES FGD Pond area at the Tier 1 MNA screening level, samples of overburden, porewater and groundwater were collected in May 2019 and analyzed to provide a geochemical dataset that was used for a supplemental assessment in addition to previously-reported groundwater data (Golder 2019). Golder performed the supplemental assessment activities in accordance with the OGSES FGD Pond Groundwater Monitoring Program. The supplemental assessment activities included:

- Groundwater characterization to identify temporal and geographical trends, where present.
- Geochemical modeling to identify the major chemical species and evaluate saturation indices of minerals relevant to attenuation of cobalt and lithium.
- Mineralogical analysis of overburden to identify and quantify the major mineral components.

- Chemical analysis of overburden to quantify the total metal content and identify the environmentally-available fraction of metals.

Based on the results generated by this supplemental assessment, a screening-level attenuation evaluation was completed to determine the overall feasibility of MNA at the OGSES FGD Ponds.

## 2.1 Groundwater and Porewater Sampling and Analysis

### 2.1.1 Sample Collection

Golder personnel collected groundwater and porewater samples from the background wells, downgradient or "monitoring" wells, porewater, and nature and extent monitoring wells presented in Table 1. The nature and extent of the plume was fully delineated in accordance with 40 CFR §257.95(g) (Golder 2019).

### 2.1.2 Geochemical Analysis

Geochemical analysis of porewater and groundwater samples included the determination of field parameters and the concentrations of total metals and major cations and anions. The rationale and methods used were as follows:

**Field Parameters:** Parameters measured in the field included pH, dissolved oxygen, oxidation reduction potential (ORP), conductivity, and temperature. These parameters were used to determine general geochemical conditions in the groundwater and support geochemical modeling.

**Metals:** Analysis of Appendix III and IV metals concentrations was conducted to understand the geochemical composition of groundwater and porewater. Metals analysis allows for the delineation of a potential plume, evaluation of mineral saturation indices, development of partitioning coefficients (in conjunction with solid material analyses), and evaluation of background contributions from natural sources or anthropogenic sources.

**Major Cations and Anions**: Geochemical modeling of mineral solubility, metals attenuation and background contributions requires analysis of major cations and anions because they affect and participate in sorption and mineral dissolution or precipitation reactions.

The groundwater and porewater samples were analyzed using the following methods:

- pH following SW846 9040C "pH Electrometric Measurement" (USEPA 2004)
- Total dissolved solids standard method (SM) 2540C "Total Dissolved Solids Dried at 180°C" (USEPA 1993a)
- Total hardness following SM 2340B (USEPA 1997)
- Chloride and fluoride following USEPA SW846 9056A "Determination of Inorganic Anions by Ion Chromatography", Revision 1 (USEPA 2007c)
- Nitrate and nitrite following EPA 353.2 "Determination of Nitrate-Nitrite Nitrogen by Automated Colorimetry, Revision 2.0" (USEPA 1993b)
- Alkalinity following SM 2320B "Alkalinity by Titration" (USEPA 2005a)
- Phosphorous following SM 4500-P E "Phosphorous by Ascorbic Acid Method" (USEPA 2005b)

- Total Target Analyte List (TAL) metals following USEPA SW846 6010C “Inductively Coupled Plasma-Atomic Emission Spectrometry”, Revision 3, SW846 6020B “Inductively Coupled Plasma-Mass Spectrometry”, Revision 2, and SW846 6020A “Inductively Coupled Plasma-Mass Spectrometry”, Revision 1 (USEPA 1998)

### 2.1.3 Geochemical Modeling Approach

Geochemical modeling was conducted to evaluate general groundwater and porewater quality, determine the potential for precipitation of sorbent media, evaluate the potential for mineral precipitation or adsorption in the aquifer, and determine the speciation of metals of interest. The geochemical computer code developed by the United States Geological Survey (USGS), PHREEQC, was used for these simulations (Parkhurst and Appelo 2013). PHREEQC version 3.4 is a general-purpose geochemical modeling code used to simulate reactions in water and between water and solid mineral phases (e.g., rocks and sediments). Reactions include aqueous equilibria, mineral dissolution and precipitation, ion exchange, surface complexation, solid solutions, gas-water equilibrium, and kinetic biogeochemical reactions. The widely-accepted thermodynamic database Minteq.v4, 2017 edition, was used as a basis for the thermodynamic constants required for modeling.

The Geochemist’s Workbench version 12 (Bethke 2015) was used to generate graphical representations of geochemical modeling outputs in the form of predominance, or Pourbaix diagrams (also known as Eh-pH diagrams) for the species of interest (i.e. barium, cobalt, lithium, selenium, and elemental radium) and trilinear plots (also known as Piper plots) displaying the relative abundance of major ions. The Minteq.v4 database was used as the basis for the Pourbaix diagrams.

The potential for mineral precipitation was assessed in PHREEQC using a saturation index (SI) calculated according to Equation 1.

$$SI = \log (IAP/Ksp) \qquad \text{(Equation 1)}$$

The saturation index is the ratio of the ion activity product (IAP) of a mineral to the solubility product (Ksp). An SI value greater than zero indicates that the water is supersaturated with respect to a particular mineral phase and, therefore, precipitation of the mineral may occur. An evaluation of precipitation kinetics is then required to determine whether the supersaturated mineral will indeed form. An SI value less than zero indicates the water is undersaturated with respect to a particular mineral phase. An SI value close to zero indicates equilibrium conditions exist between the mineral and the solution. SI values between -0.5 and 0.5 are referred to as ‘at equilibrium’ in this report.

### 2.1.4 Data Handling and Geochemical Modeling Assumptions

Assumptions related to data handling and geochemical modeling assumptions were as follows:

- **Groundwater continuity:** Groundwater quality data from a single sampling event conducted from May 16, 2019 to June 6, 2019 were evaluated. This sampling event was selected because all wells related to the FGD Ponds were sampled and analyzed for the full suite of parameters described in Section 2.1.2 and the resulting data are assumed to provide a comprehensive overview of groundwater conditions. Temporal trend analysis for cobalt and lithium made use of all available sampling events from a well (up to 11 samples from some wells), dating back to November 2015.
- **Porewater chemistry:** The porewater samples collected from FGD Pond A and FGD Pond B are assumed to be representative of porewater found in the FGD Ponds at the OGSES FGD Pond area.

- **Redox values:** ORP values measured in the field were converted to reduction potential (Eh) by adding 200 millivolts (mV) to the field-measured values as per YSI (2015).
- **Non-detect values:** Constituents with concentrations less than their respective method detection limits were assumed to have a concentration equal to the reporting limit in model simulations.
- **Total recoverable concentrations:** Total recoverable fraction results were used for geochemical modeling.
- **Charge balance:** Groundwater compositions with charge balance errors less than 10% were considered valid. Compositions with charge balance errors greater than 10% were included in the assessment but would be considered less reliable and are denoted as such.

## 2.2 Overburden Sampling and Analysis

### 2.2.1 Sample Collection

A drilling contractor collected continuous cores from two nature and extent well borings (FGD-15 and FGD-16) and one soil boring and (FGD-2019-1) located downgradient of the CCR units. Golder staff collected overburden samples from drill cores obtained at various intervals at the three locations ranging from 23' below ground surface to up to 32' below ground surface. These samples are representative of the saturated uppermost aquifer downgradient of the CCR Units, which is underlain by a confining sandy clay unit.

These samples were submitted to the laboratory for analysis under chain-of-custody procedures. The unique descriptions used to identify the samples included the overburden boring name and depth of the sample below ground surface (bgs). Sample locations and depths are described in Table 2. Boring logs are provided in Appendix A.

### 2.2.2 Overburden Analysis

Multiple geochemical analytical methods were used to assess the mineralogical and chemical composition of the overburden material samples. The selected geochemical test methods included:

- **Mineralogical composition**: The purpose of the mineralogical analysis was to identify and quantify the crystalline mineral phases in each sample. This information is required for geochemical modeling as the release or attenuation of constituents of interest is influenced by the mineral phase(s) present in the aquifer (Hem 1985). The mineralogical testing laboratory (SGS Minerals Services) performed the mineralogical analysis using quantitative (Rietveld) X-ray diffraction (XRD) (ME-LR-MIN-MET-MN-DO5) and a Bruker AXS D8 Advance Diffractometer.
- **Total metals:** This test was used to quantify the chemical composition of overburden materials. The total mass of metals, in combination with the results of sequential extraction testing, can be used to determine the provenance of metals and verify sequential extraction results. The laboratory analyzed a target analyte list of metals following the methods USEPA SW846 6010C "Inductively Coupled Plasma-Atomic Emission Spectrometry", Revision 3 (November 2000).
- **Sequential extraction (SEP):** This test consists of a seven-step metals extraction from solids as per Tessier et al. (1979) to identify the provenance of constituents of interest (i.e. the operationally-defined

fraction that contains the metal)[1] and determine their potential environmental mobility. For instance, metals bound in the carbonate fraction, or that are exchangeable, are much more likely to become mobile due to changes in groundwater conditions than metals bound within a sulfide or silicate fraction. The total concentration of a metal measured from all seven steps can be compared to the concentration determined from the total metal analysis for compositional accountability. The laboratory analyzed the metals content of the extracted samples using the method USEPA SW846 6020B "Inductively Coupled Plasma-Mass Spectrometry", Revision 2 (July 2014).

## 3.0 GROUNDWATER AND POREWATER CHARACTERIZATION

Groundwater quality data from background wells FGD-8 and FGD-11; monitoring wells FGD-1, FGD-2, FGD-3, FGD-4, FGD-5, FGD-6, and FGD-12; nature and extent monitoring wells FGD-14, FGD-15, and FGD-16; and porewater samples FGD-A-2019-1 and FGD-B-2019-1 were used for this evaluation. The water quality monitoring data are presented in Appendices A and can be summarized as follows:

**General Chemistry Parameters**

- pH: The pH of groundwater samples collected from monitoring and nature and extent wells ranged from 6.5 to 6.9 across the site in May and June 2019. Historically, pH was lowest in June of 2018, at 5.6 in FGD-1 and the highest pH measured in groundwater was 7.1 in FGD-6 in February 2016. No geographical trend in pH was discernable in groundwater samples. The pH of porewater was approximately 6.5 in June 2019.
- ORP (Redox): Field-measured redox values in May and June 2019, corrected to Eh (+200mV), ranged from +144 to +181 mV in the groundwater samples in the CCR monitoring well network. The Eh of groundwater in the nature and extent monitoring wells ranged from +168 mV to +193 mV, indicating that redox conditions were similar to those in the CCR monitoring network wells. Redox measurements were not obtained for porewater.
- Total Dissolved Solids (TDS): Groundwater TDS concentrations were variable in May 2019 in the CCR monitoring and nature and extent well network. The lowest TDS concentrations (140 mg/L) occurred in groundwater at CCR monitoring well FGD-12. The highest measured TDS in groundwater (3970 mg/L) was observed in CCR monitoring well FGD-8. The TDS in groundwater of the nature and extent network ranged from 325 mg/L to 2,880 mg/L in wells FGD-16 and FGD-15, respectively. Geographically, the highest TDS observed in groundwater (in wells FGD-8 and FGD-15) is found on opposite sides of the FGD Pond area. The TDS of porewater is much higher than that of groundwater, ranging from 7,240 to 7,410 mg/L.

[1] Sequential extraction of metals from overburden samples consisted of seven discrete steps for this investigation:

Step 1 - Exchangeable Fraction: This extraction includes trace elements that are reversibly adsorbed to overburden minerals, amorphous solids, and/or organic material by electrostatic forces.

Step 2 - Carbonate Fraction: This extraction targets trace elements that are adsorbed or otherwise bound to carbonate minerals.

Step 3 – Non-Crystalline Materials Fraction: This extraction targets trace elements that are complexed by amorphous minerals (e.g., iron).

Step 4 - Metal Hydroxide Fraction: Trace elements bound to hydroxides of iron, manganese, and/or aluminum.

Step 5 - Organic Fraction: This extraction targets trace elements strongly bound via chemisorption to organic material.

Step 6 - Acid/Sulfide Fraction: The extraction is used to identify trace elements precipitated as sulfide minerals.

Step 7 - Residual Fraction: Trace elements remaining in the overburden after the previous extractions will be distributed between silicates, phosphates, and refractory oxides.

- Major ion chemistry: A Piper plot was generated for groundwater samples to facilitate the identification of water types and source contributions (Figure 1a). Generally speaking, background, downgradient, and nature and extent wells plotted in a region of the trilinear plot separate from the FGD Pond water samples. Upon further investigation of three specific ions (sulfate, magnesium, and sodium) (Figure 1b), the difference between groundwater from CCR monitoring wells and nature and extent wells and FGD Pond water becomes more apparent. Based on the molar ratios of these ions, the composition of groundwater in all wells (downgradient, background and nature and extent) is very different from that of porewater.

- Iron: Oxidized iron (ferric iron - $Fe^{+3}$) concentrations were variable, ranging from non-detect (<0.05 mg/L) to 61 mg/L in May and June of 2019 (Appendix B). Reduced iron (ferrous iron - $Fe^{+2}$) was non-detect (<0.05 mg/L) in all groundwater samples except for FGD-6, where it was measured at 202 mg/L. In this well, the highest trivalent iron concentration of 61 mg/L was also observed. Ferrihydrite, an oxidized iron hydroxide mineral, would likely be present based on these data, and ferrihydrite attenuation of cobalt has been well studied (Smith 1999). Ferric and ferrous iron concentrations were both below detection limits in porewater samples.

- Nutrients: Nitrate (nitrate as N) was present in groundwater at monitoring and nature and extent wells at variable levels, ranging from non-detect (< 0.1 mg/L as N) to 1.54 mg/L as N at FGD-2 in May 2019 (Appendix B). Nitrate was the highest in porewater, ranging from 1.87 to 3.24 mg/L in ponds A and B, respectively. Phosphate concentrations in groundwater ranged from 0.049 to 0.714 mg/L in CCR monitoring and nature and extent wells. Phosphate was not detected (<0.03 mg/L) in porewater samples. No spatial trend was apparent in the nitrate or phosphate distribution in groundwater. However, the presence of nitrate in porewater confirms a likely oxic state of porewater (not measured).

**Constituents with SSL Notification:**

- Cobalt: Cobalt concentrations in groundwater samples from nature and extent wells or CCR monitoring network wells did not exceed the GWPS (0.016 mg/L) for cobalt in May and June 2019 (Figure 2a). The cobalt concentration in groundwater collected from the downgradient nature and extent monitoring well FGD-14 was non-detect (<0.003 mg/L) in May 2019. Cobalt in groundwater across the entire monitoring network was lowest in downgradient wells; the highest concentration was measured at 0.0132 mg/L in FGD-6 in May 2019. The highest cobalt in groundwater measured in May to June 2019 was in FGD-8, an upgradient background well, at 0.0146 mg/L, but still below the GWPS. The cobalt concentration in FGD-3, where previous exceedances of the GWPS occurred, was below the GWPS in the latest samples (Figure 2a). Cobalt was not detected in the porewater of FGD Pond A or B (Appendix A). Based on historical trends, cobalt concentrations at the FGD Pond area are stable or decreasing in all wells as of May 2019 (Figure 2a). Cobalt is likely present in groundwater as the divalent cation $Co^{+2}$ based on the pH and Eh of groundwater (Figure 3a).

- Lithium: Lithium concentrations in groundwater samples collected from the nature and extent and CCR monitoring well networks were all below the GWPS (0.149 mg/L) in May and June 2019 (Figure 2b). Lithium levels in nature and extent wells ranged from 0.0056 mg/L to 0.0768 mg/L in FGD-14 and FGD-15, respectively. The lithium concentration in groundwater from well FGD-14, which is the nature and extent well downgradient closest to the FGD Ponds, was just above detection limit of 0.005 mg/L at 0.0056 mg/L, and over an order of magnitude below the GWPS. The concentration in FGD-5, where historical GWPS occurrences occurred, was below the GWPS during the May 2019 sampling (Figure 2b). Lithium in

porewater ranged from 0.167 to 0.172 mg/L, only slightly above its GWPS (Appendix A). Based on historical trends, lithium in groundwater at the FGD Pond area appears to be stable or decreasing at all wells as of May 2019 (Figure 2b). Lithium is likely present in groundwater as the monovalent cation $Li^+$ based on the pH and Eh of groundwater (Figure 3b).

In summary, the groundwater data at the FGD Pond area show that concentrations of metals of interest in groundwater are decreasing or stable. The absence of cobalt in porewater of the FGD Ponds demonstrates that the ponds are not a likely source of cobalt to groundwater. As indicated by major ion compositions (Figures 1a and b), porewater from the FGD Ponds is substantially different than downgradient groundwater, suggesting an absence of direct interaction between porewater and groundwater.

## 3.1 Geochemical Modeling Results

The results of speciation modeling of groundwater at background, downgradient, nature and extent wells, and porewater are provided in Table 3. Mineral saturation plays an important role in attenuation of metals, either directly by their removal through mineral precipitation, or indirectly by providing a sorptive surface. The results can be summarized as follows:

- Iron-bearing minerals: Ferrihydrite [$Fe(OH)_3$] was simulated to be at equilibrium or oversaturated in all groundwater samples, indicating a strong potential for ongoing precipitation of solid phase iron oxides. Thus, throughout the FGD Ponds area, the prevalence of iron oxides is assumed.
- Other minerals: In all groundwater samples where barium was measured, groundwater was in equilibrium with barite [$BaSO_4$]. Calcite [$CaCO_3$] was in equilibrium was groundwater at wells FGD-3, FGD-8, and FGD-11. The formation of barite and calcite can help control dissolved metal concentrations by providing both a sorptive surface for metal attenuation and through co-precipitation of COIs (Smith 1999; Zhang et al. 2014).

In summary, barite, calcite, and ferrihydrite contribute to controlling groundwater composition at some or all of the monitoring wells. Particularly in the case of ferrihydrite, the dissolved concentrations of certain COIs can be reduced through the ability of these minerals to act as a substrate for adsorption in addition to precipitation/co-precipitation.

# 4.0 COMPOSITIONAL ANALYSIS OF OVERBURDEN

## 4.1 Mineralogical Composition

Quantitative X-ray diffraction (XRD) with Rietveld refinement was used to identify and quantify minerals in three overburden samples collected during the drilling activities - one sample from each of the soil borings completed in June 2019 (FGD-15, FGD-16, and FGD-2019-1). These samples were obtained to better understand the mineralogical composition of the aquifer system and identify any minerals that would potentially influence attenuation of constituents of interest. In contrast, the presence of certain minerals could also indicate a potential for naturally-occurring release of metals into groundwater, for instance due to oxidation of sulfide minerals.

The mineralogical analysis identified the materials in boreholes samples at the FGD Ponds predominately consist of quartz with varying amounts of the silicate minerals K-feldspar, plagioclase, and muscovite. A trace amount of magnesite [$MgCO_3$] was encountered in one sample. Analytical reports for the XRD samples are provided in Appendix B.

### 4.1.1 Chemical Composition and Sequential Extraction

Chemical analysis and sequential extractions were used to determine the chemical composition of the overburden and the distribution of constituents of interest over various operationally-defined fractions comprising the overburden. This testing was completed per Table 1 on overburden from three borehole locations, (reported in Table 4).

A description of the individual fractions determined by sequential extraction is presented in Footnote 1, Section 2.2.2. Metals extracted in steps 1 through 5 are considered environmentally available, whereas metals extracted in steps 6 and 7 are present in refractory fractions and are not expected to be released under conditions typically encountered in aquifers (Tessier et al. 1979). Total metal quantities from the sequential extraction are expressed as "SEP Total" in Table 4. The sum of the sequential extraction steps is also presented for comparison but does not represent an analytically-determined value.

The results from the chemical analysis and sequential extraction can be summarized as follows:

**General Soil Parameters**

- Aluminum: Aluminum is not a constituent of interest (COI) at the site but it has been well studied as a sorbing medium in soils (e.g., Karamalidis and Dzombak 2011). Total aluminum in soils ranged from 29,890 mg/kg to 41,270 mg/kg, and the environmentally-available fraction ranged from just 690 mg/kg (FGD-15) to 1,927 mg/kg (FGD-2019-1; Figure 4). Aluminum in the soil at the site is, therefore, largely (~88% to 94%) present in the residual, or silicate-bound fraction. This fraction is likely at least partially represented by hydrous aluminum phyllosilicates minerals or clays intermixed in the silica sand matrix. Clays can represent an important sorptive reservoir for numerous trace metals and metalloids (Uddin 2017).
- Iron: While not a COI, iron and its minerals commonly represent one of most abundant reservoirs for metal/metalloid attenuation in soils (Dzombak and Morel 1990; Smith 1999). Iron was present in all three core samples analyzed, varying from 5,458 mg/kg (FGD-15) to 8,961 mg/kg (FGD-2019-1). In all samples, the sulfide and residual fractions accounted for the largest proportion of total iron (61% to 73%) and, as such, most of the iron is not environmentally available (Figure 5). However, the remainder of the iron in the samples is largely present in the metal hydroxide phase. This fraction, part of the labile component in steps 1 through 5, can generally be considered representative of the amount of iron in soil that may be available as a sorbing medium and can, therefore, along with aluminum be used as a proxy to determine the potential for attenuation of cobalt and lithium.

**Constituents Identified with an SSL Notification**

- Cobalt: Total cobalt in soil ranged from 1.8 mg/kg to 69.9 mg/kg while the environmentally-available fraction ranged from 1.0 mg/kg in FGD-15 to 67.6 mg/kg in FGD-2019-1, representing from 58% to 97% of total cobalt (Figure 6). Cobalt in FGD-2019-1 was well above the level that would be considered naturally occurring in typical soils and rock (Hem 1985), with almost all cobalt associated with the metal hydroxide and amorphous metal fractions. Although cobalt was present in the soil of FGD-2019-1 at higher level compared to other soils samples, cobalt concentrations in groundwater from FGD-3 and FGD-14, the closest wells next to and downgradient of FGD-2019-1, respectively, were non-detect, or just above the detection limit of 0.005 mg/L. Also, cobalt was not detected in the porewater of FGD Pond A or B.

- Lithium: Total lithium in soil ranged from 8.74 mg/kg to 19.9 mg/kg, of which between 76% and 97% of the lithium occurred in the non-environmentally-available fraction (Figure 7). All lithium that was environmentally available (0.27 mg/kg to 4.7 mg/kg) was present in the amorphous metal and metal hydroxide fractions. This indicates the high likelihood of the presence of naturally-occurring lithium contained within the non-environmentally available fractions and potential attenuation of lithium by amorphous and metal hydroxide minerals at the site.

Based on the above results, attenuation of both COIs is likely occurring in various soil fractions. The most pronounced attenuation is associated with amorphous metals and metal hydroxides. Clays also present a viable attenuation fraction in the soil matrix.

## 5.0 ATTENUATION EVALUATION

The potential for natural attenuation of cobalt and lithium was evaluated at a screening level, in accordance with recommended practices and guidance promulgated by the US EPA and the ITRC (EPA 2007a; EPA 2007b; ITRC 2010). According to EPA (2007a), the purpose of the evaluation conducted during this screening phase is to "Demonstrate that the groundwater plume is not expanding and that sorption of the contaminant onto aquifer solids is occurring where immobilization is the predominant attenuation process." Based on this definition, the following observations support MNA as a viable corrective measure for the OGSES FGD Pond area:

- **Plume Stability:** Based on the water quality monitoring data presented in this assessment, groundwater concentrations of cobalt and lithium in groundwater at the FGD Pond area appear to be stable or decreasing at all wells. Cobalt is unlikely to originate from the FGD Ponds due to its absence in FGD porewater. It is also possible that lithium in groundwater does not originate just from the FGD Ponds given the high relative of lithium in soils/overburden in a non-environmentally available, likely naturally-occurring phase. These observations indicate that the distribution of cobalt and lithium, in the aquifer is stable and in the case of cobalt cannot be linked to the FGD Ponds.

- **Magnitude of Exceedances**: Occasional exceedances and the trend at some wells of cobalt and lithium in groundwater do not amount to levels that would be considered an SSL per the CCR Rule (Golder 2019). Levels of both cobalt and lithium in groundwater were both below their respective GWPS as of May 2019. Cobalt and lithium have only ever exceeded the GWPS in two monitoring wells, FGD-3 and FGD-5. Since February 2016, cobalt in groundwater has only exceeded the GWPS in monitoring well FGD-3, and lithium in groundwater has only exceeded the GWPS in FGD-5. I the case of cobalt, as of the most recent sampling (May 2019), the highest concentration was measured in FGD-8, a background well.

- **FGD Pond Porewater:** Historical records are not available for ash additions or porewater concentrations over the lifespan of the CCR units. However, based on recent porewater data, cobalt has not been measured in the FGD Ponds above detection limits. This indicates that the FGD Ponds are not likely to be a current source of cobalt.

- **Groundwater Chemistry:** The groundwater monitoring results, and the findings of the geochemical modeling support the potential for natural attenuation of cobalt and lithium. The major relative ion abundance of porewater compared to that of groundwater at monitoring wells indicated distinctly different composition and thus potentially no direct connection between groundwater and porewater I the FGD Ponds exists. Equilibrium of groundwater with the mineral phase ferrihydrite was indicated in all groundwater

samples. Modeling results are consistent with the results from the sequential extraction analysis, which indicated amorphous and metal hydroxide fractions sequester cobalt and lithium.

- **Confirmation of Attenuation/Immobilization:** Based on both mineralogical and chemical analysis, it is evident that attenuation that cobalt and lithium is occurring. Iron, capable of forming (hydr)oxide or amorphous phases that facilitate metals attenuation (Dzombak and Morel 1990), was identified in all overburden samples. The presence of metal hydroxides in soils also supports a strong potential for cobalt and lithium attenuation (Smith 1999), which was confirmed by the sequential extraction results. In addition, lithium in groundwater is limited in extent, and is potentially being attenuated by amorphous metals, metal hydroxides or in clays (Smith 1999), as confirmed by sequential extraction testing of soil samples. The ubiquitous presence of aluminum, both identified mineralogically in the form of clay minerals and through SEP in the silicate fraction, likely also as a hydrous aluminum phyllosilicate (clay), provides an additional well-studied attenuation reservoir (Karamalidis and Dzombak 2011; Prodromou 2016; Uddin 2017). Thus, soil samples from the FGD Pond area demonstrated a significant proportion of COIs attenuated in various phases, confirming their sequestration is occurring at the OGSES.

Based on these findings, cobalt and lithium appear to be candidates for an MNA remedy application and meet the criteria for Tier I MNA in accordance with USEPA guidance (USEPA 2007a and 2007b). Based on the results of this analysis, the feasibility of MNA at the FGD Pond area can be further evaluated with a Tier II MNA evaluation if SSLs of cobalt or lithium in groundwater are identified in the future.

## 6.0 CONCLUSION

The above serves as the Tier I evaluation of MNA feasibility at the OGSES Site for cobalt and lithium with respect to the FGD Pond Area. This document and evaluation have been completed in accordance with guidance and best practices promulgated by the USEPA (USEPA 2007a and 2007b) and the ITRC (ITRC 2010). Based on the findings of this evaluation, the FGD Pond area at the OGSES is a viable candidate for MNA as a corrective measure.

**Table 2: Summary of overburden samples collected** 19122434

| Sample Location | Core Description |
|---|---|
| Assessment boring FGD-15 (25'-27') | Silty sand (SM), fine to very fine, grayish purple with some iron staining, wet, trace clay, unconsolidated |
| Assessment boring FGD-16 (30'-32') | Sand (SP), red to purple gray, well sorted, wet, unconsolidated |
| Assessment boring FGD-2019-1 (23'-25') | Sand (SW), light tan, wet, unconsolidated |

Lithologic Description

FILL, silty clay, CL, brown, moist, soft to firm.

FILL, silty sand, SM, very pale brown, dry to moist, soft, very fine grained.

FILL, silty clay, CL, dark gray, moist, firm, crumbles easily, some sand layers.

SANDY, CLAY, CL, strong brown, moist, firm, laminated, very fine grained sand

SILTY CLAY, CL, dark gray, moist, firm, with sand laminae.

SILTY CLAY, CL, mottled gray and brown, moist, firm to hard, some sand laminae, some oxidized staining.

SAND, SP, dark gray, wet, very soft to soft, very fine grained, some silty laminae.

RE: Luminant-OGSES FGD Ponds

Dear Will Vienne:

DHL Analytical, Inc. received 9 sample(s) on 5/17/2019 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-19-24

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-Fe D - Ferrous Iron Analysis (this parameter is not NELAP certified)
Method M3500-Fe D - Ferric Iron (calculation) (this calculation is not NELAP certified).
Method M4500-P E - Orthophosphate Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904 and SM 7500 Ra B M. Analyzed at Pace Analytical.

## LOG IN

The samples were received and log-in performed on 5/17/19. A total of 9 samples were received. The samples arrived in good condition and were properly packaged.

## METALS ANALYSIS

For Metals analysis performed on 5/20/19 the matrix spike and matrix spike duplicate recoveries were out of control limits for three analytes. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 5/22/19 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis peformed on 5/22/19 LCVL6-190522 was above control limits for Sodium. This is flagged accordingly. The associated CCV6-190522 was within control limits for this analyte. No further corrective actions were taken.

## ALKALINITY ANALYSIS

For Alkalinity analysis performed on 5/21/19 the recovery of the Initial Calibration Verification (ICV-190521) was slightly above control limits. This is flagged accordingly in the QC summary report. The remaining bracketing CCVs were within control limits. No further corrective actions were taken.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Donna Eidson
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RER | Replicate Error Ratio. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| | The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG. |

# ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

RE: Luminant-OGSES-FGD Pond

Dear Will Vienne:

DHL Analytical, Inc. received 1 sample(s) on 5/18/2019 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-19-24

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method E300 - Anions Analysis

LOG IN

The sample was received and log-in performed on 5/18/19. A total of 1 sample was received. The sample arrived in good condition and was properly packaged. All method blanks, laboratory spikes, and/or matrix spikes met quality assurance objectives.

RE: LUMINANT-OGSES-FGD

Dear Will Vienne:

DHL Analytical, Inc. received 2 sample(s) on 6/7/2019 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-19-24

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-Fe D - Ferrous Iron Analysis (this parameter is not NELAP certified)
Method M3500-Fe D - Ferric Iron (calculation) (this calculation is not NELAP certified).
Method M4500-P E - Orthophosphate Analysis
Method M2540C - TDS Analysis

## LOG IN

The samples were received and log-in performed on 6/7/19. A total of 2 samples were received. The samples arrived in good condition and were properly packaged.

## METALS ANALYSIS

For Metals analysis performed on 6/12/19 the matrix spike and matrix spike duplicate recoveries were below control limits for Sodium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

## FERRIC IRON CALCULATION

The Ferric Iron is calculated as the Total Iron minus the Ferrous Iron.

# Method Summary

***Mineral Identification and Interpretation:***

Mineral identification and interpretation involve matching the diffraction pattern of a test sample material to patterns of single-phase reference materials. The reference patterns from the Crystallography Open Database (COD) and the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

***Quantitative Rietveld Analysis:***

Panalytcal Highscore Plus software was used to perform the quantitative Rietveld Analysis. This software uses a graphics based profile analysis program built around a non-linear least squares fitting system, to quantitatively determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile (shown as a blue pattern in the analyses plots) until it matches the obtained experimental patterns (shown as the coloured pattern in the analyses plots).

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.5 wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

**DISCLAIMER:** This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. RE: LUMINANT-OGSES-PONDS

Dear Will Vienne:

DHL Analytical, Inc. received 2 sample(s) on 6/7/2019 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-19-24

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-Fe D - Ferrous Iron Analysis (this parameter is not NELAP certified)
Method M3500-Fe D - Ferric Iron (calculation) (this parameter is not NELAP certified)
Method M4500-P E - Orthophosphate Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904 and SM 7500 Ra B M. Analyzed at Pace Analytical.

## LOG IN

The samples were received and log-in performed on 6/7/19. A total of 2 samples were received. The samples arrived in good condition and were properly packaged.

## METALS ANALYSIS

For Metals analysis performed on 6/12/19 the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron and Sodium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RER | Replicate Error Ratio. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |

# ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

## Qualifiers

### Metals

| Qualifier | Qualifier Description |
|---|---|
| * | LCS or LCSD is outside acceptance limits. |
| * | RPD of the LCS and LCSD exceeds the control limits |
| B | Compound was found in the blank and sample. |
| F3 | Duplicate RPD exceeds the control limit |
| F5 | Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL. The data are considered valid because the absolute difference is less than the RL. |
| J | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

## Glossary

| Abbreviation | These commonly used abbreviations may or may not be present in this report. |
|---|---|
| ¤ | Listed under the "D" column to designate that the result is reported on a dry weight basis |
| %R | Percent Recovery |
| CFL | Contains Free Liquid |
| CNF | Contains No Free Liquid |
| DER | Duplicate Error Ratio (normalized absolute difference) |
| Dil Fac | Dilution Factor |
| DL | Detection Limit (DoD/DOE) |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC | Decision Level Concentration (Radiochemistry) |
| EDL | Estimated Detection Limit (Dioxin) |
| LOD | Limit of Detection (DoD/DOE) |
| LOQ | Limit of Quantitation (DoD/DOE) |
| MDA | Minimum Detectable Activity (Radiochemistry) |
| MDC | Minimum Detectable Concentration (Radiochemistry) |
| MDL | Method Detection Limit |
| ML | Minimum Level (Dioxin) |
| NC | Not Calculated |
| ND | Not Detected at the reporting limit (or MDL or EDL if shown) |
| PQL | Practical Quantitation Limit |
| QC | Quality Control |
| RER | Relative Error Ratio (Radiochemistry) |
| RL | Reporting Limit or Requested Limit (Radiochemistry) |
| RPD | Relative Percent Difference, a measure of the relative difference between two points |
| TEF | Toxicity Equivalent Factor (Dioxin) |
| TEQ | Toxicity Equivalent Quotient (Dioxin) |

## Job ID: 140-15376-1

### Laboratory: Eurofins TestAmerica, Knoxville

**Narrative**

**Job Narrative**
**140-15376-1**
**Revised**

This report has been revised to change the sample IDs as requested by the client.

**Receipt**
The samples were received on 5/24/2019 at 9:40 AM. The samples arrived in good condition, properly preserved, and on ice. The temperature of the cooler at receipt was 0.8º C.

**Metals - 7 Step Sequential Extraction Procedure**
These soil samples were prepared and analyzed using Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0008, "7 Step Sequential Extraction Procedure". SW-846 Method 6010B as incorporated in Eurofins TestAmerica Knoxville standard operating procedure KNOX-MT-0007 was used to perform the final instrument analyses.

An aliquot of each sample was sequentially extracted using the steps listed below:

- ***Step 1 - Exchangeable Fraction***: A 5 gram aliquot of sample was extracted with 25 mL of 1M magnesium sulfate (MgSO4), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 2 - Carbonate Fraction:*** The sample residue from step 1 was extracted with 25 mL of 1M sodium acetate/acetic acid (NaOAc/HOAc) at pH 5, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 3 - Non-crystalline Materials Fraction:*** The sample residue from step 2 was extracted with 25 mL of 0.2M ammonium oxalate (pH 3), centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 4 - Metal Hydroxide Fraction:*** The sample residue from step 3 was extracted with 25 mL of 1M hydroxylamine hydrochloride solution in 25% v/v acetic acid, centrifuged and filtered. 5 mL of the resulting leachate was digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 5 - Organic-bound Fraction:*** The sample residue from step 4 was extracted three times with 25 mL of 5% sodium hypochlorite (NaClO) at pH 9.5, centrifuged and filtered. The resulting leachates were combined and 5 mL were digested using method 3010A and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 6 - Acid/Sulfide Fraction***: The sample residue from step 5 was extracted with 25 mL of a 3:1:2 v/v solution of HCl-HNO3-H2O, centrifuged and filtered. 5 mL of the resulting leachate was diluted to 50 mL with reagent water and analyzed by method 6010B. Results are reported in mg/kg on a dry weight basis.
- ***Step 7 - Residual Fraction:*** A 1.0 g aliquot of the sample residue from step 6 was digested using HF, HNO3, HCl and H3BO3. The digestate was analyzed by ICP using method 6010B. Results are reported in mg/kg on a dry weight basis.

In addition, a 1.0 g aliquot of the original sample was digested using HF, HNO3, HCl and H3BO3. The digestate was analyzed by ICP using method 6010B. Total metal results are reported in mg/kg on a dry weight basis.

Results were calculated using the following equation:

Result, µg/g or mg/Kg, dry weight = (C × V × V1 × D) / (W × S × V2)

Where:
C = Concentration from instrument readout, µg/mL
V = Final volume of digestate, mL
D = Instrument dilution factor
V1 = Total volume of leachate, mL
V2 = Volume of leachate digested, mL
W = Wet weight of sample, g
S = Percent solids/100

A method blank, laboratory control sample and laboratory control sample duplicate were prepared and analyzed with each SEP step in

## Job ID: 140-15376-1 (Continued)

### Laboratory: Eurofins TestAmerica, Knoxville (Continued)

order to provide information about both the presence of elements of interest in the extraction solutions, and the recovery of elements of interest from the extraction solutions. Results outside of laboratory QC limits do not reflect out of control performance, but rather the effect of the extraction solution upon the analyte.

A laboratory sample duplicate was prepared and analyzed with each batch of samples in order to provide information regarding the reproducibility of the procedure.

**SEP Report Notes:**
The final report lists the results for each step, the result for the total digestion of the sample, and a sum of the results of steps 1 through 7 by element.

Magnesium was not reported for step 1 because the extraction solution for this step (magnesium sulfate) contains high levels of magnesium. Sodium was not reported for steps 2 and 5 since the extraction solutions for these steps contain high levels of sodium. The sum of steps 1 through 7 is much higher than the total result for sodium and magnesium due to the magnesium and sodium introduced by the extraction solutions.

The step 1 digestates were reanalyzed for vanadium at a 1/10 dilution due to positive interelement interferences resulting from the high magnesium results. The reporting limits were adjusted accordingly.

The digestates for steps 1, 2 and 5 were analyzed at a dilution due to instrument problems caused by the high solids content of the digestates. The reporting limits were adjusted accordingly.

The serial dilution performed for the following samples associated with batch 140-31255 was outside control limits: (140-15376-A-1-A SD ^5), (140-15376-A-1-A SD ^50) and (140-15376-A-1-AA SD ^50)

Samples FGD-15 (25-27) (140-15376-1), FGD-16 (30-32) (140-15376-2), FGD-2019-1 (23-25) (140-15376-3), (140-15376-A-1-AB DU) and (140-15376-A-1-B DU) were diluted due to the presence of silicon or titanium which interferes with Arsenic, Cobalt, Selenium and Thallium. Elevated reporting limits (RLs) are provided.

Sample FGD-2019-1 (23-25) (140-15376-3) was diluted due to the presence of titanium which interferes with Cobalt. Elevated reporting limits (RLs) are provided.

There was a difference between the Total Metals results for cobalt and the Total SEP result for cobalt. At the client's request, the cobalt results for SEP 3 and SEP 4 were confirmed by reanalysis, and the total analysis for metals was reanalyzed with a separate aliquot. The original results for SEP 3 and SEP 4 were confirmed, but the reanalysis of the totals was much higher than the original test result. This suggests that the sample is heterogeneous, as different total cobalt results are obtained by the three tests. The affected sample is FGD-2019-1 (23-25) (140-15376-3).

The sample duplicate (DUP) precision for preparation batch 140-30453, 140-30480, 140-30481, 140-31696 and 140-31697 and analytical batch 140-31197 was outside control limits. Sample non-homogeneity is suspected.

The sample duplicate (DUP) precision for preparation batch 140-30852 and analytical batch 140-31255 was outside control limits. Sample non-homogeneity is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**General Chemistry - % Moisture**
The samples were analyzed for percent moisture using SOP number KNOX-WC-0012 (based on Modified MCAWW 160.3 and SM2540B and on the percent moisture determinations described in methods 3540C and 3550B).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

**Comments**
No additional comments.

# GROUNDWATER SAMPLING RECORD

PAGE 1 of 1

Project Number: 191 22262-F Project Name: LUMINANT - OGSES Date: 5-16-19

Sample Number: FGD-3

Sampling Location (well ID, etc.): FGD-3

Sampled by: JTB

Measuring Point (MP) of Well: TOC/PVC

Screened Interval (ft. BGL): -

Filter Pack Interval (ft. BGL): -

Starting Water Level (ft. BMP): 22.13

Casing Stickup (ft.): -

Starting Water Level (ft. BGL): 22.13

Total Depth (ft. BGL): -

Casing Diameter (In ID): 2.0

Casing Volume (gal.):

## QUALITY ASSURANCE

METHODS (describe):

Cleaning Equipment: alconox & DI rinse

Purging: peristaltic / bladder Sampling: same

Disposal of Discharged Water: on site

INSTRUMENTS (Indicate make, model, I.d.)

Water Level: KECK Thermometer: HORIBA

pH Meter: HORIBA Field Calibration: 7-4

Conductivity Meter: HORIBA Field Calibration: 1413

Filter / Filter Size: - Other:

## SAMPLING MEASUREMENTS

| 1032 Time | Cum. Vol. (gal. or L) | Purge Rate (gal. or L/m) | Temp. (oC) | pH | Spec. Cond. (mmhos/cm) | D.O | Redox (mV) | Turbidity & Color | Water Depth (ft BMP) |
|---|---|---|---|---|---|---|---|---|---|
| 1041 | - | .2 | 23.1 | 6.71 | 1620 | 0.71 | -57 | 6.7 | 22.31 |
| 1047 | | 1 | 22.7 | 6.74 | 1630 | 0.61 | -56 | 7.1 | 22.32 |

# 1.0 OVERVIEW

Oak Grove Management Company LLC (Luminant) operates the FGD-A-Pond, FGD-B-Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds"), approximately 0.25 miles northeast of the Oak Grove Steam Electric Station (OGSES), in Robertson County, Texas. Luminant manages Coal Combustion Residuals (CCR) generated from the OGSES in the FGD Ponds per the applicable requirements of 40 Code of Federal Regulations (CFR) Part 257 Subpart D as amended (CCR Final Rule). A map of the FGD Ponds is provided on Exhibit 1.

Statistically significant levels (SSLs) of cobalt and lithium above groundwater protection standards (GWPS) were detected in the uppermost aquifer downgradient of the FGD Ponds during 2018 assessment monitoring. In response to the 2018 cobalt and lithium SSLs, an Assessment of Corrective Measures (ACM) report was completed for the FGD Ponds in September 2019 as required by 40 CFR § 257.96 (Golder 2019a). The ACM evaluated various source control and groundwater response technologies to address the cobalt and lithium SSLs. However, an Alternate Source Demonstration (ASD) completed in accordance with 40 CFR § 257.95(g)(3)(ii) in October 2020 (Golder 2020) indicated that a source other than the FGD Ponds caused the lithium SSL and lithium has therefore been eliminated as a constituent of concern at the FGD Ponds. The ACM was updated in May 2021 (Golder 2021) to remove lithium from the list of constituents evaluated in the ACM. In addition, updated statistical analyses for cobalt incorporating 2019 and 2020 assessment monitoring data indicate that cobalt is also no longer present at SSLs above the GWPS downgradient of the FGD Ponds; however, for the purposes of the ACM, Luminant continues to evaluate potential groundwater remedies for cobalt based on the 2018 SSL.

The ACM identified monitored natural attenuation (MNA) as a potential groundwater response technology for cobalt downgradient of the FGD Ponds. To supplement the findings of the ACM, Golder was retained by Luminant to further evaluate the overall feasibility of MNA as a groundwater remedial alternative for the FGD Ponds in accordance with 40 CFR §257.97. Golder based the MNA feasibility evaluation on United States Environmental Protection Agency (USEPA) guidance for using MNA as a remedial strategy (USEPA 2007a, b) and best practices in the Interstate Technology Regulatory Council (ITRC) document: "A Decision Framework for Applying Monitored Natural Attenuation Processes to Metals and Radionuclides in Groundwater" (ITRC 2010).

USEPA guidance recommends that the overall feasibility of MNA as a groundwater response technology be evaluated based on the following multi-tier approach (USEPA 2007a, b):

1) Demonstrate active constituent removal from groundwater and dissolved plume stability (Tier I).

2) Determine the mechanisms and rates of the operative attenuation processes (Tier II).

3) Determine the long-term capacity for attenuation and the stability of immobilized constituents (Tier III).

A Tier I MNA Evaluation for the FGD Ponds was completed in December 2019 (Golder 2019b). The Tier I Evaluation concluded that sufficient evidence was present to satisfy the Tier I criteria for successful MNA implementation to address the cobalt SSL. Further geochemical evaluation (i.e., Tier II and Tier III Evaluation) of MNA was recommended in the Tier I report. This memorandum presents the findings of the Tier II and Tier III MNA Evaluation for the FGD Ponds area.

The results of the Tier II and III Evaluation will be used to further assess the performance and reliability of MNA as a potential remedial alternative as required by 40 CFR §257.97. Following completion of this multi-tier evaluation, the fourth and final tier of an MNA program, which involves the design of a performance monitoring program and the development of a contingency plan, will be completed.

## 2.0 TIER II AND TIER III EVALUATION APPROACH

In 2019, Golder collected samples of overburden, groundwater, and porewater as part of a Nature and Extent Evaluation and Tier I Evaluation in accordance with the CCR Final Rule. Groundwater data collection and analysis at the FGD Ponds continued throughout and after the completion of the Tier I Evaluation, and the water quality results are used in the Tier II and III Site Evaluation presented herein. The additional groundwater data collection consisted of three sampling events (August 2019, May 2020, and September 2020). Data from those events are included in Appendix A. The general groundwater quality and trends for constituents with SSLs (previously including lithium) were described in detail in the Tier I report (Golder 2019b). No substantial changes in groundwater quality have occurred that would change the findings of the Tier I Evaluation.

The Tier II and III Evaluation expands upon the Tier I findings as follows:

- **Plume Stability:** Based on the water quality monitoring data presented in this assessment, groundwater concentrations of cobalt outside of the FGD Ponds at monitoring wells are relatively stable or decreasing (Figure 1). As of September 2020 (the most recent sampling event), the concentration of cobalt in groundwater in all but one downgradient monitoring well (FGD-6) was below the detection limit (<0.003 mg/L). At well FGD-3, where previously an SSL of cobalt was indicated, cobalt levels have not exceeded the GWPS since September 2018.
- **Magnitude of Exceedances**: Occasional exceedances of the cobalt GWPS in some wells do not amount to levels that would be considered an SSL per the CCR Rule (Golder 2019a). Cobalt is currently not at an SSL in groundwater based on a 95% confidence interval at any CCR monitoring well (Golder 2019a; Golder 2020). The highest level of cobalt in groundwater (since monitoring began) at the FGD Ponds was observed in well FGD-1 (0.0495 mg/L on May 11, 2020). During the next sampling round, cobalt in groundwater from FGD-1 was below the detection limit (<0.003 mg/L), thus not amounting to an SSL of cobalt. Although exceeding the GWPS, the measured cobalt concentration in May 2020 is considered an outlier due to field or laboratory error rather than the presence of a continuous cobalt source affecting FGD-1.
- **FGD Pond Porewater:** Historical records are not available for ash additions or porewater concentrations over the lifespan of the CCR units. However, based on 2019 and 2020 porewater data, cobalt is not present in the FGD Ponds at levels above its GWPS (0.016 mg/L). This suggests that the FGD Ponds may not be a current source of cobalt in groundwater.
- **Groundwater Chemistry:** The groundwater monitoring results and the findings of the geochemical modeling support the potential for natural attenuation of cobalt. Equilibrium of groundwater with the mineral phase ferrihydrite, capable of adsorbing cobalt, was indicated in all groundwater samples. Further, differences in relative abundance of the major ions in groundwater indicate that porewater is geochemically distinct from groundwater. Detailed findings are presented in the Golder Tier I Evaluation (Golder 2019b).
- **Confirmation of Attenuation/Immobilization:** Based on both mineralogical and chemical analysis, it is evident that attenuation of cobalt by aquifer materials is occurring. Iron, present in the form of (hydr)oxide or amorphous phases that facilitate metals attenuation (Dzombak and Morel 1990), was identified in all overburden samples, consistent with the inferred presence of ferrihydrite based on the geochemical modeling. The ubiquitous presence of aluminum, in the form of aluminum oxides and clay minerals, provides an additional well-studied attenuation reservoir (Karamalidis and Dzombak 2011; Uddin 2017). Thus, overburden samples from the FGD Ponds demonstrate sequestration of constituents of interest is occurring.

The Tier II and III Evaluation presented in this document builds upon the results of the Tier I Evaluation by undertaking the following:

- Evaluation of temporal and geographical trends in groundwater quality data to estimate site-wide attenuation rates.
- Geochemical modeling to determine the aqueous speciation of cobalt and evaluate saturation indices of minerals relevant to its attenuation.
- Determination of the capacity of different mechanisms to attenuate cobalt, including adsorption, precipitation and co-precipitation, and physical attenuation (dilution/dispersion).
- Geochemical modeling to assess the stability and reversibility of attenuation due to adsorption.

Additionally, the results from the following analyses described in the Tier I Evaluation for aquifer solids are utilized as part of the Tier II and III Evaluation:

- Mineralogical analysis of aquifer solids to identify and quantify the major mineral components.
- Chemical analysis and sequential extraction procedure (SEP) of aquifer solids to quantify the total metal content and identify the environmentally available fractions of metals.

The approach to and results of the Tier II and Tier III Evaluation are presented in the next sections to establish a basis for the likely success of MNA at the FGD Ponds area.

# 3.0 MODELING APPROACH

## 3.1 General Approach

### 3.1.1 Estimation of Attenuation Rates

To evaluate the attenuation of cobalt in groundwater at the FGD Ponds and to assess the rate of attenuation, the point decay method (Newell et al. 2009) was applied. The point decay method is used to determine the rate at which a constituent's concentrations are increasing or decreasing in groundwater at a single well between sampling events. This method can thus be used to predict when the constituent's concentrations will fall back below regulatory limits.

Equation 1 describes first-order decay for a constituent:

$$Ln(C_t) = kt + Ln(C_0) \quad \text{(Equation 1)}$$

where $C_0$ is the initial constituent concentration, $C_t$ is the constituent concentration at time t, t is the amount of time in years that has passed since the initial measurement, and k is the first-order decay rate constant.

Equation 2 shows Equation 1 reorganized to solve for the decay rate constant:

$$k = (Ln(C_t) - Ln(C_0))/t \quad \text{(Equation 2)}$$

Groundwater quality data from the upgradient and downgradient wells collected from November 2015 to September 2020 were used to determine the mean first-order decay rate for each constituent of interest. Due to variable detection limits, results that were reported as below detection were not used in the point decay analysis. Equation 1 and the mean first-order decay rate were used to calculate the number of years required for cobalt concentrations greater than the GWPS to decrease below the threshold.

### 3.1.2 Geochemical Speciation Modeling

Baseline geochemical modeling was conducted to evaluate general groundwater and porewater quality, determine the potential for precipitation of sorbent media, evaluate the potential for mineral precipitation or adsorption in the aquifer, and determine the speciation of cobalt. The geochemical computer code PHREEQC, developed by the United States Geological Survey (USGS), was used for these simulations (Parkhurst and Appelo 2013). PHREEQC version 3.4 is a general-purpose geochemical modeling code used to simulate reactions in water and between water and solid mineral phases (e.g., rocks and sediments). Reactions include aqueous equilibria, mineral dissolution and precipitation, ion exchange, surface complexation, solid solutions, gas-water equilibrium, and kinetic biogeochemical reactions. The widely accepted thermodynamic database Minteq.v4, 2017 edition, was used as a basis for the thermodynamic constants required for modeling (Allison et al. 1991).

### 3.1.3 Groundwater Modeling

Golder developed a three-dimensional numerical groundwater model based on the MODFLOW groundwater-flow source code created by the USGS (McDonald and Harbaugh 1988) using Visual MODFLOW (Version 4.6). The groundwater model simulates steady state groundwater flow conditions in the FGD Ponds. The results of the groundwater model were incorporated into the reactive transport geochemical model discussed in Section 3.1.4. The groundwater model was developed based on:

- Natural hydrologic boundaries, wherever possible.
- Ground surface topography and pond geometry.
- Geologic layers with representative structural properties based on boring logs.
- Hydraulic properties of geologic layers based on historical aquifer tests conducted at the site.
- Historical groundwater elevation measurements.

Details on key parameters used to develop the groundwater model are presented in Appendix B.

### 3.1.4 Reactive Transport Modeling

Additional geochemical modeling was performed to assess viable attenuation mechanisms and predict the quantity and stability of the attenuated constituents of interest. To do so, Golder used PHAST, a three-dimensional reactive transport modeling computer program developed by the USGS that simulates multicomponent reactive solute transport in a three-dimensional saturated groundwater flow system (Parkhurst et al. 2010). PHAST is a versatile groundwater flow and solute-transport simulator with capabilities to model a wide range of equilibrium and kinetic geochemical reactions. The flow and transport calculations are based on a modified version of HST3D that is restricted to constant fluid density and constant temperature. PHAST can be used to simulate both confined and unconfined flow using both a steady state and transient flow solution. The geochemical reactions are simulated with the geochemical model PHREEQC-RM (based on PHREEQC version 3.4), which is embedded in PHAST, resulting in a full three-dimensional reactive transport model. In the application used here, parameters from the site groundwater flow model developed in MODFLOW (i.e. hydraulic conductivities of layers, model layering, model architecture, water balance, groundwater velocities, and fluid head calculations) were directly used as initial and target model values to ensure seamless model coordination with

MODFLOW, without the need to rebuild a groundwater flow model independently in another software package capable of simulating geochemical reactions.

### 3.1.5 Source Control Modeling

For the purposes of the ACM, it was assumed that some degree of source control will be considered for the FGD Ponds, since one of the listed objectives in §257.97(b) for the corrective measures is to control the source of releases of Appendix IV constituents to the environment from the CCR Unit. The OGSES FGD Ponds are an integral part of the CCR management system at the plant and potential source control technologies will be designed to keep the FGD Ponds in operation.

FGD-B and FGD-C are constructed with composite liner systems that comply with the requirements of §257.71(a)(1)(ii) of the CCR Rule and these ponds are considered lined surface impoundments under the Rule. Since the liner systems in these ponds comply with the CCR Rule, FGD-B and FGD-C provide an appropriate level of source control as currently constructed and no modifications are necessary to these ponds.

FGD-A is constructed with a clay liner and the pond is considered an unlined surface impoundment as defined in § 257.71(a)(1)(i). The pond is currently out of service. The FGD-A is being retrofitted with a new composite liner system that complies with the requirements of §257.71(a)(1)(ii) of the CCR Rule to improve the level of source control in the pond. The new liner system will be installed in general accordance with the following procedures:

- Water will be removed from the pond and transferred to FGD-B and FGD-C;
- Solids in the pond will be dewatered, removed and transported to the OGSES Ash Landfill 1;
- A minimum of 2 feet of the existing compacted clay liner will be retained at the base of the pond;
- A 60-mil HDPE geomembrane liner will be installed over the 2 feet of compacted clay liner
- A protective layer of soil or other material will be placed over the geomembrane liner.

Retrofitting FGD-A with a new composite liner system is assumed to serve as the source control component of the potential corrective measures for the FGD Ponds. It is estimated that the FGD-A liner retrofit will be completed in 2021.

### 3.1.6 Mineral Precipitation and Co-precipitation

The potential for mineral precipitation was assessed in PHAST by PHREEQC using a saturation index (SI) calculated according to Equation 3.

$$SI = \log (IAP/Ksp) \qquad \text{(Equation 3)}$$

The saturation index is the ratio of the ion activity product (IAP) of a mineral to the solubility product (Ksp). An SI value greater than zero indicates that the solution is supersaturated with respect to a particular mineral phase and, therefore, precipitation of this mineral may occur. An evaluation of precipitation kinetics is then required to determine whether the supersaturated mineral will indeed form. An SI value less than zero indicates the solution is undersaturated with respect to a particular mineral phase. An SI value close to zero indicates equilibrium conditions exist between the mineral and the solution. For the purpose of this evaluation, SI values between -0.5 and 0.5 were considered to represent ‘equilibrium’ to account for the uncertainties inherent in the analytical methods and geochemical modeling.

Co-precipitation was evaluated based on published literature and known association between minerals and the constituents of interest. For example, cobalt is known to co-precipitate with iron oxyhydroxides as well as adsorb to Hfo (Nordstrom and Alpers 1999). Therefore, minerals identified by PHAST/PHREEQC to be at equilibrium and supersaturated (SI > -0.5) were evaluated for their potential to host cobalt.

### 3.1.7 Adsorption Capacity and Attenuation

Adsorption is an important mechanism by which constituents in groundwater can be attenuated. The adsorptive partitioning between dissolved and solid phases was simulated during baseline modeling using PHREEQC and for predictive modeling using PHAST with a two-layer surface complexation model (SCM). The SCM approach is described in Davis and Kent (1990), with additional parameterization based on Dzombak and Morel (1990) and Karamalidis and Dzombak (2011), utilizing iron (hydrous ferric oxide [Hfo]) as ferrihydrite [$Fe(OH)_{3(am)}$], and aluminum (hydrous aluminum oxide [Hao]) as gibbsite [$Al(OH)_{3(am)}$], as adsorbing surfaces.

The amount of Hfo and Hao available at the site for attenuation was based on the iron and aluminum concentrations measured in the amorphous and metal hydroxide phase of the SEP as described in the Tier I Evaluation (Golder 2019b). The minimum, mean, and maximum iron and aluminum concentrations in aquifer solids samples were used in the adsorption models to capture the range of expected site concentrations. The Hfo and Hao surface properties (i.e. surface area, site density, and types of surface sites) from Dzombak and Morel (1990) and Karamalidis and Dzombak (2011) were used to quantify the iron and aluminum adsorption sites per mole of mineral.

The calculation methodology of Appelo and Postma (2010) was used to determine the specific quantity of sites on each mineral surface type as a function of the amount of mineral available to participate in these reactions. The methodology assumes the number of surface sites (sites) equals the product of the moles of iron [Fe] and the moles of sites per mole of iron ([sites]/[Fe]= 0.2 moles of sites per mole of iron). To determine the amount of ferrihydrite available for sorption, the Appelo and Postma methodology further assumes the mass of ferrihydrite ($M_{HFO}$) in grams (g) available equals the product of the [Fe] and the molecular weight of ferrihydrite ($MW_{HFO}$ = 88.85 g/mole). The same approach was used to calculate the number of sites from gibbsite, assuming the [sites]/[Al] is 0.41 moles of sites per mole of aluminum and the molecular weight of gibbsite is 78.003 g/mole. The range of Hfo and Hao in soils at the FGD Ponds with associated calculations is presented in Table 1.

The thermodynamic database Minteq V.4, described in Section 3.1.1, was modified for adsorption modeling because new and updated thermodynamic data have been released in the scientific literature. These new data are important to include as they allow further refinement of potential reactions, or for correction of previous data that may have been less accurate or more broadly defined. For the geochemical modeling of the FGD Ponds, numerous updates to the database were made, including the addition of data relating to partitioning coefficients for metals on gibbsite, developed by Karamalidis and Dzombak (2011).

**Table 1: Calculations of ferrihydrite and gibbsite surface parameters for predictive modeling**

| Parameter | Units | Ferrihydrite | | | Gibbsite | | |
|---|---|---|---|---|---|---|---|
| | | Minimum | Mean | Maximum | Minimum | Mean | Maximum |
| Geometric Mean of Aquifer Solids Composition | mg/kg X | 1458 | 2131 | 3461 | 623 | 1030 | 1862 |
| | mmol X | 26.11 | 38.16 | 61.98 | 23.09 | 38.17 | 69.01 |
| | mol X | 2.61E-02 | 3.82E-02 | 6.20E-02 | 2.31E-02 | 3.82E-02 | 6.90E-02 |
| Surface Site Concentration | mol weak sites / mol X | 0.2 | 0.2 | 0.2 | 0.41 | 0.41 | 0.41 |
| | mol strong sites / mol X | 0.005 | 0.005 | 0.005 | --- | | |
| Surface Sites | mol weak | 5.2E-03 | 7.6E-03 | 1.2E-02 | 9.5E-03 | 1.6E-02 | 2.8E-02 |
| | mol strong | 1.3E-04 | 1.9E-04 | 3.1E-04 | --- | | |
| Mass of Ferrihydrite or Gibbsite | grams | 2.32 | 3.39 | 5.51 | 2.05 | 3.39 | 6.13 |

**Notes:**
X = Fe or Al depending on the mineral
Gibbsite only has one site 'type'

## 3.2 Model Calibration

Calibration of the unconfined flow reactive transport model involved adjusting the flux from the FGD Ponds, the concentration of the constituents of interest (cobalt), and the starting date for ash placement in the ponds. This calibration process simulated the gradual addition of ash to the ponds and was generally based on records of pond construction and certification (PBW 2017). The preliminary hydraulic head for PHAST targeted the steady state solution imported from MODFLOW and achieved a coefficient of determination ($R^2$) value of 0.9999 between the PHAST and MODFLOW results based on 75 sample point locations (Figure 2).

A hypothetical source solution was developed to represent the initial water quality in the FGD Ponds. Cobalt concentrations in the hypothetical source solution were increased relative to actual reported concentrations to achieve reasonable calibration with measured values in downgradient wells. Cobalt was measured at 0.00625 mg/L or less in porewater samples during the May 2020 sampling event, but that concentration required an increase to 0.044 mg/L to achieve model calibration.

To achieve calibration of cobalt sorption to aquifer solids, the surface site densities for Hfo and Hao were adjusted within the range of the measured minimum and maximum aluminum and iron concentrations in overburden. Background water quality was based on water quality results from background monitoring well FGD-8 and FGD-11 and was set to equilibrium with adsorptive surfaces. Calibration results for cobalt demonstrated good agreement in downgradient monitoring wells (Table 2), despite likely historical variability in source composition and ash placement in the FGD Ponds area. Compositional heterogeneity in terms of aquifer characteristics is likely to be present along the groundwater flow pathway but was not captured within the model. Use of the minimum surface site concentrations of Hfo and Hao calculated in Table 1 showed the best agreement with the target cobalt concentrations presented in Table 2.

**Table 2: Calibration of parameters in PHAST for predictive modeling as compared to the target values measured in 2020 in downgradient wells**

| Downgradient Monitoring Well | Units | Cobalt | |
|---|---|---|---|
| | | Target Value | Modeled |
| FGD-1 | mg/L | 0.003 | 0.003 |
| FGD-2 | mg/L | 0.003 | 0.003 |
| FGD-3 | mg/L | 0.004 | 0.003 |
| FGD-4 | mg/L | 0.003 | 0.003 |
| FGD-5 | mg/L | 0.003 | 0.003 |
| FGD-6 | mg/L | 0.005 | 0.003 |
| FGD-12 | mg/L | 0.003 | 0.003 |

The Peclet and Courant numbers included in the reactive transport modeling were used to evaluate model validity and control numerical dispersion. These values are calculated based on the cell size, time step, dispersivity, and average velocity of groundwater in the model. Equation 4 was used to control numerical dispersion using an upstream-in-space and backwards-in-time differencing solution based on a derivation of the Peclet and Courant numbers:

$$\frac{\Delta X}{2} + \frac{V_x \Delta t}{2} \ll \alpha \qquad \text{(Equation 4)}$$

Where:

$\Delta X$= Cell size (50ft)

$V_x$= Average Velocity (4 feet/year)

$\Delta t$ = Timestep (1 year)

$\alpha$= Longitudinal dispersivity (50 ft)

## 3.3 Long-Term Stability of Attenuated Constituents

The long-term stability of constituent attenuation and potential for re-mobilization was evaluated using the results of a 50-year simulation period. Specifically, the responses of the constituents of interest to modeled changes in pH and redox of groundwater at downgradient wells were evaluated. Variations in pH and redox are the most likely changes in groundwater chemistry that will occur in an aquifer over time, affecting the stability of the non-conservative constituents of interest, such as cobalt (ITRC 2010). For example, if the pH or redox should decrease substantially over time, causing the dissolution of ferrihydrite, re-mobilization of adsorbed cobalt would

be likely. In contrast, if pH were to increase substantially (>8), cobalt precipitation as cobalt carbonate may enhance the long-term stability of cobalt attenuation, possibly maintaining low levels of cobalt in groundwater (Nordstrom and Alpers 1999; Smith 1999). The long-term stability and reversibility of attenuation were also evaluated for scenarios involving complete source control (i.e., the capping of the ponds, reducing any flux from the ponds).

## 3.4 Data Handling and Geochemical Modeling Assumptions

Assumptions related to data handling practices and geochemical modeling were as follows:

- **Groundwater continuity:** Groundwater and porewater quality data from sampling events conducted from May 2019 to September 2020 were evaluated. These sampling events were selected because all wells related to the FGD Ponds were sampled and analyzed for the full suite of parameters described in the Tier I Evaluation (Golder 2019b); the resulting data are assumed to provide a comprehensive overview of Site conditions. Temporal trend analysis of pH and cobalt in groundwater made use of all available sampling events from a well (14 samples in total), dating back to November 2015.
- **Background groundwater chemistry:** Groundwater samples collected from FGD-8 and FGD-11 were assumed to represent natural background conditions for the purpose of geochemical and predictive modeling.
- **Porewater chemistry:** The porewater samples collected from the FGD-A and FGD-B ponds were assumed to be representative of porewater found in the FGD Ponds at the OGSES FGD Pond area.
- **Redox values:** Oxidation-reduction potential (ORP) values measured in the field were converted to redox potential (Eh) by adding 200 millivolts (mV) to the field-measured values as per YSI (2015).
- **Non-detect values:** Constituents with concentrations less than their respective method detection limits were assumed to have a concentration equal to the reporting limit in model simulations.
- **Total recoverable concentrations:** Total recoverable fraction results were used for geochemical modeling.
- **Charge balance:** Groundwater compositions with charge balance errors less than 10% were considered valid. Compositions with charge balance errors greater than 10% were included in the assessment but would be considered less reliable.

# 4.0 MODELING RESULTS

## 4.1 Hydrogeology

Based on soil borings completed at the site, the geology near the FGD Ponds generally consists of an upper zone of relatively thick, interbedded sand and clay strata, which is underlain by a lower zone of interbedded silty to clayey sand and well sorted sand (PBW 2017). The uppermost groundwater-bearing unit (GWBU) occurs under unconfined conditions within the shallow sand units at the site. Groundwater elevations are generally highest near the western side of the OGSES Ash Landfill I, which is located southeast of the FGD Ponds at the site and relatively flat in the vicinity of the FGD Ponds. Since CCR monitoring began in 2015, the inferred groundwater flow direction at the site has been to the east-northeast toward Twin Oak Reservoir.

The groundwater model consisted of three layers representing the three geological zones identified at the site. The model incorporated site-specific characteristics such as ground surface topography, groundwater elevation measurements, average elevations and thicknesses of the geological zones, geometry of the ponds, and hydraulic characteristics based on aquifer tests conducted as part of the CCR groundwater monitoring system certification (PBW 2017). Groundwater potentiometric heads in the model were calibrated based on groundwater elevations and inferred flow conditions observed at the site; specifically, to conditions observed during the May 2019 CCR groundwater monitoring event. Consistent with observations during the May 2019 and other historical groundwater monitoring events, groundwater was modeled to generally flow to the east northeast toward Twin Oaks Reservoir, with an average groundwater flow velocity of approximately 0.012 feet per day, or 4.4 feet per year. Additional groundwater model details are provided in Appendix B.

## 4.2 Capacity of Attenuation Mechanisms

### 4.2.1 Adsorption to Iron and Aluminum Oxyhydroxides

The Hfo and Hao surface area and sorption site calculations for the minimum, mean, and maximum iron and aluminum concentrations in aquifer solids are presented in Table 1. Adsorption modeling in PHAST revealed adequate capacity to attenuate cobalt based on current levels measured in downgradient monitoring wells. The term “adequate”, as used in this document, refers to the capacity needed to attenuate constituents in groundwater to a level that meets the site-specific GWPS (ITRC 2010). Figure 3 shows the modeled concentrations over time for cobalt for the seven downgradient compliance monitoring wells, accounting for adsorption to iron and aluminum oxyhydroxides and dilution/dispersion.

Cobalt attenuation measured by SEP was highly variable, ranging from 1.8 to 70 mg/kg and, therefore, was not used to evaluate modeled surface attenuation. As can be seen in Figure 3, the combination of attenuation by aluminum and iron oxyhydroxides and dilution/dispersion results in concentrations of cobalt below the GWPS from 5 years after closure. Further, the cobalt concentrations in porewater below the GWPS support the conclusion that adequate attenuation capacity exists downgradient of the CCR Units.

Modeling of mineral precipitation also identified consistent equilibrium of groundwater with ferrihydrite in all downgradient wells from May and June 2019 and May 2020 (events where iron was measured in groundwater). Thus, if the concentrations of cobalt in porewater at the FGD Ponds remain below the GWPS, the downgradient capacity to attenuate these constituents by iron and/or aluminum oxyhydroxides will not be exceeded under the current and simulated future groundwater pH and redox conditions, presented in Figures 4 and 5, respectively.

### 4.2.2 Co-precipitation

In addition to adsorption, co-precipitation, or the direct incorporation of trace metals such as cobalt into precipitated iron oxide-oxyhydroxides, has been well studied (e.g., Butt et al. 2000; Dzombak and Morel 1990; Smith 1999; Hem 1992). Predicted cobalt concentrations from the adsorption modeling fell within the range of cobalt for the aquifer solids analyzed by sequential extraction in the combined amorphous and metal hydroxide phases described in the Tier I Evaluation (Golder 2019b). This suggests that cobalt may also be attenuated during the formation of ferrihydrite as opposed to following its formation as crystalline mineral phase (Butt et al. 2000; Tebo et al. 2004).

### 4.2.3 Physical Attenuation

Figures 3 through 5 present the predicted cobalt concentration and pH and redox conditions over time at downgradient monitoring wells, accounting for physical attenuation (i.e., dilution and dispersion) in addition to

chemical attenuation downgradient of the CCR Units using PHAST. Boron, a well-known conservative tracer for CCRs, was selected for evaluation of physical attenuation. The observed boron levels in groundwater at downgradient wells in 2020 (<0.7 mg/L) and the range of boron concentrations in porewater (84.4 to 104 mg/L) suggest a decrease in CCR constituents of at least two orders of magnitude at downgradient wells due to dilution and dispersion alone.

### 4.2.4 Attenuation Rates

The results of the point decay analysis for groundwater at background and downgradient wells between November 2015 and September 2020 (the CCR groundwater monitoring period) are provided in Table 3, as average site attenuation rates. This evaluation indicates that cobalt concentrations in downgradient wells display decreasing (i.e. negative point decay constants) trends over time. Of note, this point decay trend does not account for any source control or mitigation options (which are currently not being implemented). Therefore, the identified decreasing trend of cobalt in downgradient wells should further benefit from source control and mitigation efforts.

Since the maximum cobalt concentration in monitoring wells has decreased below the cobalt GWPS (as of September 2020), cobalt concentrations in these wells are considered compliant. Additionally, it is considered unlikely that cobalt concentrations will continue to exceed the GWPS since predictive modeling in PHAST indicates that cobalt concentrations will reach the GWPS after source control is complete at the FGD Ponds.

**Table 3: Average Point Decay Trend Constants for Cobalt at the FGD Ponds**

| Constituents | Background Wells ($yr^{-1}$) | Downgradient Wells ($yr^{-1}$) | GWPS (mg/L) | Maximum Most Recent Value (mg/L) | Time to Achieve Compliance (years) |
|---|---|---|---|---|---|
| Cobalt | 0.03 | -0.03 | 0.016 | 0.00615 | Compliant |

Predictive modeling in PHAST used a more conservative approach to estimate the time to compliance by taking into account source control and increased source concentrations needed to achieve model calibration as previously described (Table 2). Based on this approach, considering source control, the estimated time to attenuation to a concentration below the GWPS increased to 5 years for cobalt. This is due to the elevated hypothetical source values for cobalt (0.044 mg/L) required to achieve model calibration. The simulated source value used was 7 times higher than the actual measured porewater values. Therefore, PHAST modeling presents the most conservative approach to determining the rate of attenuation. The actual time in which significant attenuation can likely be achieved falls between the two approaches used (i.e., the point decay method – concentrations currently below the GWPS - and the PHAST method – concentrations below the GWPS after 5 years).

## 4.3 Long-Term Stability of Attenuated Constituents

The expected trends over time for pH and Eh are presented in Figures 4 and 5, respectively. Variations in pH and Eh are arguably the most important factors, other than physical attenuation, controlling the long-term stability of cobalt.

Predictive modeling in PHAST indicates that the pH and Eh in the FGD Ponds will remain stable. The pH, initially ranging from approximately 6.7 to 6.8 is simulated to remain constant (<0.15 change in pH from year 0 to year 50). The Eh, initially ranging from approximately 480 to 500 mV, will also remain stable, with a slight increase in the overall range over time (from approximately 475 to 505 mV). At these predicted pH and Eh ranges,

ferrihydrite, the mineral phase primarily responsible for attenuation of cobalt, is modeled to remain stable across the FGD Ponds.

The long-term stability of cobalt can thus be summarized as follows:

- Attenuated cobalt should remain stable or decrease based on the range of pH and Eh values predicted at the site in the 50 years after closure and source control (Figures 4 and 5, respectively). It is not anticipated that attenuated cobalt will mobilize and exceed the GWPS in the future once compliance is achieved. For the anticipated pH range of the FGD Ponds area, Stenge and Peterson (1989) list a partitioning coefficient of 1.9 to 200 L/kg for cobalt while Hfo and Hao will remain stable. Additionally, the stability of ferrihydrite will also ensure any co-precipitated cobalt will remain sequestered. Thus, with source control and stable pH and Eh, long-term stability of cobalt is anticipated.

# 5.0 TIER II EVALUATION

The purpose of the Tier II Evaluation is to "Identify mechanisms and rates of the operative attenuation process" (USEPA 2007a). Based on this definition, the following modeling results and observations support MNA as a viable corrective measure for the FGD Ponds CCR Units:

- **Adsorption Capacity Modeling:** PHAST modeling results show that adsorption is likely attenuating cobalt downgradient of the CCR Unit. This is concluded based on equilibration of site-specific groundwater compositions with the range of Hfo and Hao concentrations observed in SEP results of FGD Ponds aquifer solids. Predictive modeling also demonstrates the future aquifer's capacity to adsorb constituents from the CCR Units is significant and adequate when source control has been implemented. In addition to metal oxyhydroxides, clay minerals and/or particulate organics can also act as a substrate for attenuation (Uddin 2017), but this mechanism was not included in the current evaluation. The presence of cobalt in the amorphous and metal oxyhydroxide fractions of soils indicates that adsorption is occurring across the monitored area downgradient of the CCR Unit.

- **Co-precipitation:** In addition to adsorption, co-precipitation or the direct incorporation of trace metals into precipitated iron oxide-oxyhydroxides is a well-documented process. Cobalt concentrations indicated by adsorption modeling fall within the range of cobalt for the aquifer solids analyzed by sequential extraction in the combined amorphous and metal hydroxide phases described in the Tier I Evaluation (Golder 2019b).

- **Attenuation Rates:** Cobalt concentrations in downgradient monitoring wells are already below the GWPS based upon the most recent September 2020 sampling event. Ongoing source control activities should support continued long-term attenuation. Therefore, the rate of attenuation is "adequate", as defined in USEPA guidance.

- **Dilution/Dispersion (Physical Attenuation) Modeling:** While not directly modeled, boron concentrations in porewater and in downgradient wells can be used to infer dilution and dispersion. In 2020, boron levels in porewater were 84.4 to 104 mg/L and < 0.7 mg/L in downgradient wells. Therefore, it is likely that physical attenuation accounts for a decrease in concentration of at least two orders of magnitude between porewater and groundwater at downgradient wells.

Based on these findings, cobalt is considered to be a candidate for an MNA remedy application and deemed to meet the criteria for Tier II MNA in accordance with USEPA guidance (USEPA 2007a and 2007b).

## 6.0 TIER III EVALUATION

According to USEPA (USEPA 2007a), the purpose of the Tier III Evaluation is to eliminate sites for an MNA remedy where (1) "Capacity of the aquifer is insufficient to attenuate the COC mass to regulatory standards" and/or (2) "Stability of the immobilized COC is insufficient to prevent remobilization due to future changes in groundwater chemistry". Based on this definition, the following observations support MNA as a viable corrective measure for the FGD Ponds:

- **Adsorption Capacity Modeling:** Predictive modeling has demonstrated that porewater concentrations of cobalt could increase to 0.044 mg/L and yet result in concentrations at downgradient monitoring wells below its GWPS in a reasonable time frame. The time frame is defined here as "reasonable" when it is comparable to time frames associated with other active remediation options described in an assessment of corrective measures (Golder 2019a; ITRC 2010). However, cobalt concentrations in porewater samples from the FGD Ponds only reached detectable levels once (0.00625 mg/L) and always remained below the GWPS (0.016 mg/L). Therefore, based on the current concentrations in the FGD Ponds, the current concentrations observed in downgradient monitoring wells, and the anticipated source control activities, it is concluded that the combined long-term attenuation from sorption, dilution, and dispersion is sufficient to attenuate the cobalt mass in the FGD Ponds to concentrations below the GWPS. In addition to aluminum and iron oxyhydroxides, cobalt is known to be attenuated by other sorbents (e.g., manganese (hydr)oxides, clay minerals, and particulate organic matter) not included in the modeling, providing additional sorption capacity at the FGD Ponds.
- **Stability of Constituents:** Reactive transport modeling indicates that the pH and Eh (i.e. the factors controlling adsorption, which is the primary attenuation mechanism) will remain stable over time. As such, both the sorption effectiveness as well as the stability of the ferrihydrite adsorptive surfaces will remain constant. The stability of gibbsite, another adsorptive surface considered in the modeling, is less dependent on pH and Eh and will remain constant within the expected range of groundwater conditions. The total aluminum and iron contents in aquifer solids, based on the Tier I Evaluation (Golder 2019b), range from 30,000 to 42,000 mg/kg and 5,000 to 9,000 mg/kg, respectively (by SEP Total), indicating a significant reservoir potentially available for attenuation, and a reservoir that is resilient to changes in pH and Eh. It should be noted that there is no historical basis to expect large future deviations in groundwater pH and/or redox conditions.

## 7.0 CONCLUSION

This report presents the results of a Tier II and III Evaluation conducted to determine the feasibility of using MNA as a remedial strategy for cobalt at the FGD Ponds. This evaluation has been completed in accordance with guidance and best practices promulgated by the USEPA (USEPA 2007a and 2007b) and the ITRC (ITRC 2010). Based on the results of this evaluation, the following is concluded regarding cobalt:

- Physical and chemical attenuation of cobalt is occurring. Cobalt levels are stable, and the aquifer has adequate capacity to attenuate cobalt in a reasonable timeframe. Modeling indicates that cobalt attenuation will be efficient and stable in the long term. Cobalt in porewater is well below the level that is observed in groundwater, including when a periodic exceedance occurs in downgradient groundwater. Therefore, cobalt is considered a candidate for MNA at the FGD Ponds.

It is recommended that a Tier IV Evaluation be completed to design a long-term MNA monitoring plan in the event that MNA is selected as the final remedy for cobalt at the FGD Ponds.

RE: Luminant-OGSES FGD Ponds

Dear Will Vienne:

DHL Analytical, Inc. received 12 sample(s) on 8/21/2019 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-19-24

## Laboratory Review Checklist: Reportable Data

| | |
|---|---|
| **Project Name:** Luminant-OGSES FGD Ponds | **LRC Date:** 9/25/19 |
| **Reviewer Name:** Carlos Castro | **Laboratory Work Order:** 1908215 |
| **Prep Batch Number(s):** See Prep Dates Report | **Run Batch:** See Analytical Dates Report |

| #[1] | A[2] | Description | Yes | No | NA[3] | NR[4] | ER#[5] |
|---|---|---|---|---|---|---|---|
| | | **Chain-of-Custody (C-O-C)** | | | | | |
| **R1** | OI | **1)** Did samples meet the laboratory's standard conditions of sample acceptability upon receipt? | **X** | | | | **R1-01** |
| | | **2)** Were all departures from standard conditions described in an exception report? | | | **X** | | |
| **R2** | OI | **Sample and Quality Control (QC) Identification** | | | | | |
| | | **1)** Are all field sample ID numbers cross-referenced to the laboratory ID numbers? | **X** | | | | |
| | | **2)** Are all laboratory ID numbers cross-referenced to the corresponding QC data? | **X** | | | | |
| **R3** | OI | **Test Reports** | | | | | |
| | | **1)** Were all samples prepared and analyzed within holding times? | **X** | | | | |
| | | **2)** Other than those results < MQL, were all other raw values bracketed by calibration standards? | **X** | | | | |
| | | **3)** Were calculations checked by a peer or supervisor? | **X** | | | | |
| | | **4)** Were all analyte identifications checked by a peer or supervisor? | **X** | | | | |
| | | **5)** Were sample detection limits reported for all analytes not detected? | **X** | | | | |
| | | **6)** Were all results for soil and sediment samples reported on a dry weight basis? | | | **X** | | |
| | | **7)** Were % moisture (or solids) reported for all soil and sediment samples? | | | **X** | | |
| | | **8)** Were bulk soils/solids samples for volatile analysis extracted with methanol per EPA Method 5035? | | | **X** | | |
| | | **9)** If required for the project, TICs reported? | | | **X** | | |
| **R4** | O | **Surrogate Recovery Data** | | | | | |
| | | **1)** Were surrogates added prior to extraction? | | | **X** | | |
| | | **2)** Were surrogate percent recoveries in all samples within the laboratory QC limits? | | | **X** | | |
| **R5** | OI | **Test Reports/Summary Forms for Blank Samples** | | | | | |
| | | **1)** Were appropriate type(s) of blanks analyzed? | **X** | | | | |
| | | **2)** Were blanks analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures? | **X** | | | | |
| | | **4)** Were blank concentrations < MDL? | **X** | | | | |
| | | **5)** For analyte(s) detected in a blank sample, was the concentration, unadjusted for sample specific factors, in all associated field samples, **greater** than 10 times the concentration in the blank sample? | | | **X** | | |
| **R6** | OI | **Laboratory Control Samples (LCS):** | | | | | |
| | | **1)** Were all COCs included in the LCS? | **X** | | | | |
| | | **2)** Was each LCS taken through the entire analytical procedure, including prep and cleanup steps? | **X** | | | | |
| | | **3)** Were LCSs analyzed at the required frequency? | **X** | | | | |
| | | **4)** Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits? | **X** | | | | |
| | | **5)** Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs? | **X** | | | | |
| | | **6)** Was the LCSD RPD within QC limits (if applicable)? | **X** | | | | |
| **R7** | OI | **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data** | | | | | |
| | | **1)** Were the project/method specified analytes included in the MS and MSD? | **X** | | | | |
| | | **2)** Were MS/MSD analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were MS (and MSD, if applicable) %Rs within the laboratory QC limits? | | **X** | | | **R7-03** |
| | | **4)** Were MS/MSD RPDs within laboratory QC limits? | **X** | | | | |
| **R8** | OI | **Analytical Duplicate Data** | | | | | |
| | | **1)** Were appropriate analytical duplicates analyzed for each matrix? | | | **X** | | |
| | | **2)** Were analytical duplicates analyzed at the appropriate frequency? | | | **X** | | |
| | | **3)** Were RPDs or relative standard deviations within the laboratory QC limits? | | | **X** | | |
| **R9** | OI | **Method Quantitation Limits (MQLs):** | | | | | |
| | | **1)** Are the MQLs for each method analyte included in the laboratory data package? | **X** | | | | |
| | | **2)** Do the MQLs correspond to the concentration of the lowest non-zero calibration standard? | **X** | | | | |
| | | **3)** Are unadjusted MQLs and DCSs included in the laboratory data package? | **X** | | | | |
| **R10** | OI | **Other Problems/Anomalies** | | | | | |
| | | **1)** Are all known problems/anomalies/special conditions noted in this LRC and ER? | **X** | | | | |
| | | **2)** Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results? | **X** | | | | |
| | | **3)** Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package? | **X** | | | | |

## Laboratory Name: DHL Analytical, Inc.

## Laboratory Review Checklist (continued): Supporting Data

| | |
|---|---|
| **Project Name:** Luminant-OGSES FGD Ponds | **LRC Date:** 9/25/19 |
| **Reviewer Name:** Carlos Castro | **Laboratory Work Order:** 1908215 |
| **Prep Batch Number(s):** See Prep Dates Report | **Run Batch:** See Analytical Dates Report |

| #[1] | A[2] | Description | Yes | No | NA[3] | NR[4] | ER#[5] |
|---|---|---|---|---|---|---|---|
| **S1** | OI | **Initial Calibration (ICAL)** | | | | | |
| | | **1)** Were response factors and/or relative response factors for each analyte within QC limits? | **X** | | | | |
| | | **2)** Were percent RSDs or correlation coefficient criteria met? | **X** | | | | |
| | | **3)** Was the number of standards recommended in the method used for all analytes? | **X** | | | | |
| | | **4)** Were all points generated between the lowest and highest standard used to calculate the curve? | **X** | | | | |
| | | **5)** Are ICAL data available for all instruments used? | **X** | | | | |
| | | **6)** Has the initial calibration curve been verified using an appropriate second source standard? | **X** | | | | |
| **S2** | OI | **Initial and Continuing calibration Verification (ICCV and CCV) and Continuing Calibration blank (CCB):** | | | | | |
| | | **1)** Was the CCV analyzed at the method-required frequency? | **X** | | | | |
| | | **2)** Were percent differences for each analyte within the method-required QC limits? | **X** | | | | |
| | | **3)** Was the ICAL curve verified for each analyte? | **X** | | | | |
| | | **4)** Was the absolute value of the analyte concentration in the inorganic CCB < MDL? | **X** | | | | |
| **S3** | O | **Mass Spectral Tuning:** | | | | | |
| | | **1)** Was the appropriate compound for the method used for tuning? | **X** | | | | |
| | | **2)** Were ion abundance data within the method-required QC limits? | **X** | | | | |
| **S4** | O | **Internal Standards (IS):** | | | | | |
| | | **1)** Were IS area counts and retention times within the method-required QC limits? | **X** | | | | |
| **S5** | OI | **Raw Data (NELAC Section 5.5.10)** | | | | | |
| | | **1)** Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst? | **X** | | | | |
| | | **2)** Were data associated with manual integrations flagged on the raw data? | **X** | | | | |
| **S6** | O | **Dual Column Confirmation** | | | | | |
| | | **1)** Did dual column confirmation results meet the method-required QC? | | | **X** | | |
| **S7** | O | **Tentatively Identified Compounds (TICs):** | | | | | |
| | | **1)** If TICs were requested, were the mass spectra and TIC data subject to appropriate checks? | | | **X** | | |
| **S8** | I | **Interference Check Sample (ICS) Results:** | | | | | |
| | | **1)** Were percent recoveries within method QC limits? | **X** | | | | |
| **S9** | I | **Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions** | | | | | |
| | | **1)** Were percent differences, recoveries, and the linearity within the QC limits specified in the method? | | **X** | | | **S9-01** |
| **S10** | OI | **Method Detection Limit (MDL) Studies** | | | | | |
| | | **1)** Was a MDL study performed for each reported analyte? | **X** | | | | |
| | | **2)** Is the MDL either adjusted or supported by the analysis of DCSs? | **X** | | | | |
| **S11** | OI | **Proficiency Test Reports:** | | | | | |
| | | **1)** Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies? | **X** | | | | |
| **S12** | OI | **Standards Documentation** | | | | | |
| | | **1)** Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources? | **X** | | | | |
| **S13** | OI | **Compound/Analyte Identification Procedures** | | | | | |
| | | **1)** Are the procedures for compound/analyte identification documented? | **X** | | | | |
| **S14** | OI | **Demonstration of Analyst Competency (DOC)** | | | | | |
| | | **1)** Was DOC conducted consistent with NELAC Chapter 5 – Appendix C? | **X** | | | | |
| | | **2)** Is documentation of the analyst's competency up-to-date and on file? | **X** | | | | |
| **S15** | OI | **Verification/Validation Documentation for Methods** (NELAC Chapter 5) | | | | | |
| | | **1)** Are all the methods used to generate the data documented, verified, and validated, where applicable? | **X** | | | | |
| **S16** | OI | **Laboratory Standard Operating Procedures (SOPs):** | | | | | |
| | | **1)** Are laboratory SOPs current and on file for each method performed? | **X** | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

**Lab Order:** 1908215

# CASE NARRATIVE

Samples were analyzed using the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2540C - TDS Analysis

Exception Report R1-01

The samples were received and log-in performed on 8/21/19. A total of 12 samples were received. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Metals analysis performed on 8/27/19 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Anions analysis performed on 8/23/19 (batch 92504) the matrix spike and matrix spike duplicate recoveries (1908250-05 MS/MSD) were slightly below control limits for Chloride. These are flagged accordingly. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Exception Report S9-01

For Metals analysis performed on 8/27/19 the RPD of the serial dilution was above control limits for Boron. This is flagged accordingly in the QC summary report. The PDS was within control limits for this analyte. No further corrective actions were taken.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Donna Eidson
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RER | Replicate Error Ratio. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C2 | Tracer recovery limits have been exceeded; values are outside lower control limits. |

# ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Order No.: 2005038

RE: Luminant-OGSES-MNA

Dear Will Vienne:

DHL Analytical, Inc. received 5 sample(s) on 5/7/2020 for the analyses presented in the following report.

Revision Number 1 for Work Order 2005038: This revision consists of changing the target analyte list for 3 samples per the client's request. Please replace the original Data Report with this revision.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-20-25

| #[1] | A[2] | Description | Yes | No | NA[3] | NR[4] | ER#[5] |
|---|---|---|---|---|---|---|---|
| | | **Chain-of-Custody (C-O-C)** | | | | | |
| **R1** | OI | **1)** Did samples meet the laboratory's standard conditions of sample acceptability upon receipt? | **X** | | | | **R1-01** |
| | | **2)** Were all departures from standard conditions described in an exception report? | | | **X** | | |
| **R2** | OI | **Sample and Quality Control (QC) Identification** | | | | | |
| | | **1)** Are all field sample ID numbers cross-referenced to the laboratory ID numbers? | **X** | | | | |
| | | **2)** Are all laboratory ID numbers cross-referenced to the corresponding QC data? | **X** | | | | |
| **R3** | OI | **Test Reports** | | | | | |
| | | **1)** Were all samples prepared and analyzed within holding times? | **X** | | | | |
| | | **2)** Other than those results < MQL, were all other raw values bracketed by calibration standards? | **X** | | | | |
| | | **3)** Were calculations checked by a peer or supervisor? | **X** | | | | |
| | | **4)** Were all analyte identifications checked by a peer or supervisor? | **X** | | | | |
| | | **5)** Were sample detection limits reported for all analytes not detected? | **X** | | | | |
| | | **6)** Were all results for soil and sediment samples reported on a dry weight basis? | | | **X** | | |
| | | **7)** Were % moisture (or solids) reported for all soil and sediment samples? | | | **X** | | |
| | | **8)** Were bulk soils/solids samples for volatile analysis extracted with methanol per EPA Method 5035? | | | **X** | | |
| | | **9)** If required for the project, TICs reported? | | | **X** | | |
| **R4** | O | **Surrogate Recovery Data** | | | | | |
| | | **1)** Were surrogates added prior to extraction? | | | **X** | | |
| | | **2)** Were surrogate percent recoveries in all samples within the laboratory QC limits? | | | **X** | | |
| **R5** | OI | **Test Reports/Summary Forms for Blank Samples** | | | | | |
| | | **1)** Were appropriate type(s) of blanks analyzed? | **X** | | | | |
| | | **2)** Were blanks analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures? | **X** | | | | |
| | | **4)** Were blank concentrations < MDL? | **X** | | | | |
| | | **5)** For analyte(s) detected in a blank sample, was the concentration, unadjusted for sample specific factors, in all associated field samples, **greater** than 10 times the concentration in the blank sample? | | | **X** | | |
| **R6** | OI | **Laboratory Control Samples (LCS):** | | | | | |
| | | **1)** Were all COCs included in the LCS? | **X** | | | | |
| | | **2)** Was each LCS taken through the entire analytical procedure, including prep and cleanup steps? | **X** | | | | |
| | | **3)** Were LCSs analyzed at the required frequency? | **X** | | | | |
| | | **4)** Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits? | **X** | | | | |
| | | **5)** Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs? | **X** | | | | |
| | | **6)** Was the LCSD RPD within QC limits (if applicable)? | **X** | | | | |
| **R7** | OI | **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data** | | | | | |
| | | **1)** Were the project/method specified analytes included in the MS and MSD? | **X** | | | | |
| | | **2)** Were MS/MSD analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were MS (and MSD, if applicable) %Rs within the laboratory QC limits? | | **X** | | | **R7-03** |
| | | **4)** Were MS/MSD RPDs within laboratory QC limits? | **X** | | | | |
| **R8** | OI | **Analytical Duplicate Data** | | | | | |
| | | **1)** Were appropriate analytical duplicates analyzed for each matrix? | **X** | | | | |
| | | **2)** Were analytical duplicates analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were RPDs or relative standard deviations within the laboratory QC limits? | **X** | | | | |
| **R9** | OI | **Method Quantitation Limits (MQLs):** | | | | | |
| | | **1)** Are the MQLs for each method analyte included in the laboratory data package? | **X** | | | | |
| | | **2)** Do the MQLs correspond to the concentration of the lowest non-zero calibration standard? | **X** | | | | |
| | | **3)** Are unadjusted MQLs and DCSs included in the laboratory data package? | **X** | | | | |
| **R10** | OI | **Other Problems/Anomalies** | | | | | |
| | | **1)** Are all known problems/anomalies/special conditions noted in this LRC and ER? | **X** | | | | **R10-01** |
| | | **2)** Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results? | **X** | | | | |
| | | **3)** Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package? | **X** | | | | |

| | | **2)** Were ion abundance data within the method-required QC limits? | X | | | | |
| **S4** | O | **Internal Standards (IS):** | | | | | |
| | | **1)** Were IS area counts and retention times within the method-required QC limits? | X | | | | |
| **S5** | OI | **Raw Data (NELAC Section 5.5.10)** | | | | | |
| | | **1)** Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst? | X | | | | |
| | | **2)** Were data associated with manual integrations flagged on the raw data? | X | | | | |
| **S6** | O | **Dual Column Confirmation** | | | | | |
| | | **1)** Did dual column confirmation results meet the method-required QC? | | | X | | |
| **S7** | O | **Tentatively Identified Compounds (TICs):** | | | | | |
| | | **1)** If TICs were requested, were the mass spectra and TIC data subject to appropriate checks? | | | X | | |
| **S8** | I | **Interference Check Sample (ICS) Results:** | | | | | |
| | | **1)** Were percent recoveries within method QC limits? | X | | | | |
| **S9** | I | **Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions** | | | | | |
| | | **1)** Were percent differences, recoveries, and the linearity within the QC limits specified in the method? | X | | | | |
| **S10** | OI | **Method Detection Limit (MDL) Studies** | | | | | |
| | | **1)** Was a MDL study performed for each reported analyte? | X | | | | |
| | | **2)** Is the MDL either adjusted or supported by the analysis of DCSs? | X | | | | |
| **S11** | OI | **Proficiency Test Reports:** | | | | | |
| | | **1)** Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies? | X | | | | |
| **S12** | OI | **Standards Documentation** | | | | | |
| | | **1)** Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources? | X | | | | |
| **S13** | OI | **Compound/Analyte Identification Procedures** | | | | | |
| | | **1)** Are the procedures for compound/analyte identification documented? | X | | | | |
| **S14** | OI | **Demonstration of Analyst Competency (DOC)** | | | | | |
| | | **1)** Was DOC conducted consistent with NELAC Chapter 5 – Appendix C? | X | | | | |
| | | **2)** Is documentation of the analyst's competency up-to-date and on file? | X | | | | |
| **S15** | OI | **Verification/Validation Documentation for Methods** (NELAC Chapter 5) | | | | | |
| | | **1)** Are all the methods used to generate the data documented, verified, and validated, where applicable? | X | | | | |
| **S16** | OI | **Laboratory Standard Operating Procedures (SOPs):** | | | | | |
| | | **1)** Are laboratory SOPs current and on file for each method performed? | X | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28, 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

**Lab Order:** 2005038

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020B - Metals Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-FE D - Ferrous Iron Analysis (This parameter is not NELAP Certified)
Method M3500-FE D - Ferrous Iron Analysis (Calculated) (This parameter is not NELAP Certified)
Method M4500-P E - Orthophosphate Analysis

Exception Report R1-01

The samples were received and log-in performed on 5/7/2020. A total of 5 samples were received and analyzed. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Metals Analysis, the recovery of Sodium for the Matrix Spike and Matrix Spike Duplicate (2005013-01 MS/MSD) was below the method control limits. This is flagged accordingly in the QC Summary Report. This analyte was within method control limits in the associated LCS. No further corrective action was taken.

For Ferrous Iron Analysis, the recovery of the Matrix Spike (2005038-01 MS) was above the method control limits. This is flagged accordingly in the QC Summary Report. The associated LCS/MSD was within method control limits. No further corrective action was taken.

Exception Report R10-01

The Ferric Iron is calculated as the Total Iron minus the Ferrous Iron.

Exception Report S2-04

For Metals Analysis, Sodium was detected below the reporting limit for the Continuing Calibration Blank (CCB3-200511). This analyte was reported in QC samples only, no field samples affected. No further corrective actions were taken.

**Qualifiers:**

ND - Not Detected at the SDL
J - Analyte detected between SDL and RL
B - Analyte detected in the associated Method Blank
DF- Dilution Factor
N - Parameter not NELAP certified
See Final Page of Report for MQLs and MDLs
S - Spike Recovery outside control limits
C - Sample Result or QC discussed in Case Narrative
RL - Reporting Limit (MQL adjusted for moisture and sample size)
SDL - Sample Detection Limit
E - TPH pattern not Gas or Diesel Range Pattern

RE: Luminant-OGSES-CCR

Dear Will Vienne:

DHL Analytical, Inc. received 2 sample(s) on 5/7/2020 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-20-25

| **R6** | OI | **Laboratory Control Samples (LCS):** | | | | | |
| | | **1)** Were all COCs included in the LCS? | **X** | | | | |
| | | **2)** Was each LCS taken through the entire analytical procedure, including prep and cleanup steps? | **X** | | | | |
| | | **3)** Were LCSs analyzed at the required frequency? | **X** | | | | |
| | | **4)** Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits? | **X** | | | | |
| | | **5)** Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs? | **X** | | | | |
| | | **6)** Was the LCSD RPD within QC limits (if applicable)? | **X** | | | | |
| **R7** | OI | **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data** | | | | | |
| | | **1)** Were the project/method specified analytes included in the MS and MSD? | **X** | | | | |
| | | **2)** Were MS/MSD analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were MS (and MSD, if applicable) %Rs within the laboratory QC limits? | **X** | | | | |
| | | **4)** Were MS/MSD RPDs within laboratory QC limits? | **X** | | | | |
| **R8** | OI | **Analytical Duplicate Data** | | | | | |
| | | **1)** Were appropriate analytical duplicates analyzed for each matrix? | **X** | | | | |
| | | **2)** Were analytical duplicates analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were RPDs or relative standard deviations within the laboratory QC limits? | **X** | | | | |
| **R9** | OI | **Method Quantitation Limits (MQLs):** | | | | | |
| | | **1)** Are the MQLs for each method analyte included in the laboratory data package? | **X** | | | | |
| | | **2)** Do the MQLs correspond to the concentration of the lowest non-zero calibration standard? | **X** | | | | |
| | | **3)** Are unadjusted MQLs and DCSs included in the laboratory data package? | **X** | | | | |
| **R10** | OI | **Other Problems/Anomalies** | | | | | |
| | | **1)** Are all known problems/anomalies/special conditions noted in this LRC and ER? | **X** | | | | |
| | | **2)** Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results? | **X** | | | | |
| | | **3)** Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package? | **X** | | | | |

| | | **1)** If TICs were requested, were the mass spectra and TIC data subject to appropriate checks? | | | X | | |
| **S8** | I | **Interference Check Sample (ICS) Results:** | | | | | |
| | | **1)** Were percent recoveries within method QC limits? | X | | | | |
| **S9** | I | **Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions** | | | | | |
| | | **1)** Were percent differences, recoveries, and the linearity within the QC limits specified in the method? | | X | | | S9-01 |
| **S10** | OI | **Method Detection Limit (MDL) Studies** | | | | | |
| | | **1)** Was a MDL study performed for each reported analyte? | X | | | | |
| | | **2)** Is the MDL either adjusted or supported by the analysis of DCSs? | X | | | | |
| **S11** | OI | **Proficiency Test Reports:** | | | | | |
| | | **1)** Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies? | X | | | | |
| **S12** | OI | **Standards Documentation** | | | | | |
| | | **1)** Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources? | X | | | | |
| **S13** | OI | **Compound/Analyte Identification Procedures** | | | | | |
| | | **1)** Are the procedures for compound/analyte identification documented? | X | | | | |
| **S14** | OI | **Demonstration of Analyst Competency (DOC)** | | | | | |
| | | **1)** Was DOC conducted consistent with NELAC Chapter 5 – Appendix C? | X | | | | |
| | | **2)** Is documentation of the analyst's competency up-to-date and on file? | X | | | | |
| **S15** | OI | **Verification/Validation Documentation for Methods** (NELAC Chapter 5) | | | | | |
| | | **1)** Are all the methods used to generate the data documented, verified, and validated, where applicable? | X | | | | |
| **S16** | OI | **Laboratory Standard Operating Procedures (SOPs):** | | | | | |
| | | **1)** Are laboratory SOPs current and on file for each method performed? | X | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020B - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2540C - TDS Analysis

Exception Report R1-01

The samples were received and log-in performed on 5/7/20. A total of 2 samples were received. The samples arrived in good condition and were properly packaged.

Exception Report S9-01

For Metals analysis performed on 5/11/20 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly in the QC summary report. The PDS was within control limits for this analyte. No further corrective actions were taken.

S - Spike Recovery outside control limits
C - Sample Result or QC discussed in Case Narrative
RL - Reporting Limit (MQL adjusted for moisture and sample size)
SDL - Sample Detection Limit
E - TPH pattern not Gas or Diesel Range Pattern

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| | The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG. |

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

RE: Luminant-OGSES-FGD Ponds

Dear Will Vienne:

DHL Analytical, Inc. received 2 sample(s) on 5/12/2020 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-20-25

| | | **1)** Are laboratory SOPs current and on file for each method performed? | X | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020B - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-Fe D - Ferrous Iron Analysis (this parameter is not NELAP certified)
Method M3500-Fe D - Ferric Iron (calculation) (this calculation is not NELAP certified)
Method M4500-P E - Orthophosphate Analysis
Method M2540C - TDS Analysis

Exception Report R1-01

The samples were received and log-in performed on 5/12/20. A total of 2 samples were received. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Anions analysis performed on 5/12/20 the matrix spike and matrix spike duplicate recoveries (2005076-01 MS/MSD) were slightly below control limits for Chloride. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 5/14/20 and 5/15/20 the matrix spike and/or matrix spike duplicate recoveries were out of control limits for a total of three analytes. These are flagged accordingly. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Ferrous Iron analysis performed on 5/13/20 the matrix spike recovery was slightly above control limits. This was due to matrix effect. This is flagged accordingly. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits. No further corrective actions were taken.

Exception Report S9-01

For Metals analysis performed on 5/14/20 the PDS recovery was out of control limits for a total of three analytes. These are flagged accordingly in the QC summary report. The serial dilution was within control limits for these analytes. No further corrective actions were taken.

Entire Report Reviewed By:

Donna Eidson
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RER | Replicate Error Ratio. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

RE: Luminant-OGSES-FGD PONDS

Dear Will Vienne:

DHL Analytical, Inc. received 7 sample(s) on 5/12/2020 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-20-25

| | | **8)** Were bulk soils/solids samples for volatile analysis extracted with methanol per EPA Method 5035? | | | **X** | | |
| | | **9)** If required for the project, TICs reported? | | | **X** | | |
| **R4** | O | **Surrogate Recovery Data** | | | | | |
| | | **1)** Were surrogates added prior to extraction? | | | **X** | | |
| | | **2)** Were surrogate percent recoveries in all samples within the laboratory QC limits? | | | **X** | | |
| **R5** | OI | **Test Reports/Summary Forms for Blank Samples** | | | | | |
| | | **1)** Were appropriate type(s) of blanks analyzed? | **X** | | | | |
| | | **2)** Were blanks analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures? | **X** | | | | |
| | | **4)** Were blank concentrations < MDL? | **X** | | | | |
| | | **5)** For analyte(s) detected in a blank sample, was the concentration, unadjusted for sample specific factors, in all associated field samples, **greater** than 10 times the concentration in the blank sample? | | | **X** | | |
| **R6** | OI | **Laboratory Control Samples (LCS):** | | | | | |
| | | **1)** Were all COCs included in the LCS? | **X** | | | | |
| | | **2)** Was each LCS taken through the entire analytical procedure, including prep and cleanup steps? | **X** | | | | |
| | | **3)** Were LCSs analyzed at the required frequency? | **X** | | | | |
| | | **4)** Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits? | **X** | | | | |
| | | **5)** Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs? | **X** | | | | |
| | | **6)** Was the LCSD RPD within QC limits (if applicable)? | **X** | | | | |
| **R7** | OI | **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data** | | | | | |
| | | **1)** Were the project/method specified analytes included in the MS and MSD? | **X** | | | | |
| | | **2)** Were MS/MSD analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were MS (and MSD, if applicable) %Rs within the laboratory QC limits? | | **X** | | | **R7-03** |
| | | **4)** Were MS/MSD RPDs within laboratory QC limits? | **X** | | | | |
| **R8** | OI | **Analytical Duplicate Data** | | | | | |
| | | **1)** Were appropriate analytical duplicates analyzed for each matrix? | **X** | | | | |
| | | **2)** Were analytical duplicates analyzed at the appropriate frequency? | **X** | | | | |
| | | **3)** Were RPDs or relative standard deviations within the laboratory QC limits? | **X** | | | | |
| **R9** | OI | **Method Quantitation Limits (MQLs):** | | | | | |
| | | **1)** Are the MQLs for each method analyte included in the laboratory data package? | **X** | | | | |
| | | **2)** Do the MQLs correspond to the concentration of the lowest non-zero calibration standard? | **X** | | | | |
| | | **3)** Are unadjusted MQLs and DCSs included in the laboratory data package? | **X** | | | | |
| **R10** | OI | **Other Problems/Anomalies** | | | | | |
| | | **1)** Are all known problems/anomalies/special conditions noted in this LRC and ER? | **X** | | | | **R10-01** |
| | | **2)** Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results? | **X** | | | | |
| | | **3)** Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package? | **X** | | | | |

| | | **1)** Were percent recoveries within method QC limits? | X | | | | |
| **S9** | I | **Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions** | | | | | |
| | | **1)** Were percent differences, recoveries, and the linearity within the QC limits specified in the method? | | X | | | **S9-01** |
| **S10** | OI | **Method Detection Limit (MDL) Studies** | | | | | |
| | | **1)** Was a MDL study performed for each reported analyte? | X | | | | |
| | | **2)** Is the MDL either adjusted or supported by the analysis of DCSs? | X | | | | |
| **S11** | OI | **Proficiency Test Reports:** | | | | | |
| | | **1)** Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies? | X | | | | |
| **S12** | OI | **Standards Documentation** | | | | | |
| | | **1)** Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources? | X | | | | |
| **S13** | OI | **Compound/Analyte Identification Procedures** | | | | | |
| | | **1)** Are the procedures for compound/analyte identification documented? | X | | | | |
| **S14** | OI | **Demonstration of Analyst Competency (DOC)** | | | | | |
| | | **1)** Was DOC conducted consistent with NELAC Chapter 5 – Appendix C? | X | | | | |
| | | **2)** Is documentation of the analyst's competency up-to-date and on file? | X | | | | |
| **S15** | OI | **Verification/Validation Documentation for Methods** (NELAC Chapter 5) | | | | | |
| | | **1)** Are all the methods used to generate the data documented, verified, and validated, where applicable? | X | | | | |
| **S16** | OI | **Laboratory Standard Operating Procedures (SOPs):** | | | | | |
| | | **1)** Are laboratory SOPs current and on file for each method performed? | X | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28, 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020B - Metals Analysis
Method E300 - Anions Analysis
Method M2320 B - Alkalinity Analysis
Method M3500-FE D - Ferrous Iron Analysis (This parameter is not NELAP Certified)
Method M3500-FE D - Ferrous Iron Analysis (Calculated) (This parameter is not NELAP Certified)
Method M4500-P E - Orthophosphate Analysis

Exception Report R1-01

The samples were received and log-in performed on 5/12/2020. A total of 7 samples were received and analyzed. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Ferrous Iron Analysis, the recovery of the Matrix Spike (2005038-01 MS) was above the method control limits. This is flagged accordingly in the QC Summary Report. The associated LCS/MSD was within method control limits. No further corrective action was taken.

Exception Report R10-01

The Ferric Iron is calculated as the Total Iron minus the Ferrous Iron.

Exception Report S9-01

For Metals Analysis, the recovery of Sodium for the Post Digestion Spike (2005077-05 PDS) was below the method control limits. This is fagged accordingly in the QC Summary Report. This analyte was within method control limits in the associated Serial Dilution. No further corrective action was taken.

**Qualifiers:**

ND - Not Detected at the SDL
J - Analyte detected between SDL and RL
B - Analyte detected in the associated Method Blank
DF- Dilution Factor
N - Parameter not NELAP certified
See Final Page of Report for MQLs and MDLs
S - Spike Recovery outside control limits
C - Sample Result or QC discussed in Case Narrative
RL - Reporting Limit (MQL adjusted for moisture and sample size)
SDL - Sample Detection Limit
E - TPH pattern not Gas or Diesel Range Pattern

RE: Luminant-OGSES FGD PONDS

Dear Will Vienne:

DHL Analytical, Inc. received 7 sample(s) on 5/12/2020 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAP except where noted in the Case Narrative. All non-NELAP methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-20-25

|---|---|---|---|---|---|---|---|
| | | **Chain-of-Custody (C-O-C)** | | | | | |
| **R1** | OI | **1)** Did samples meet the laboratory's standard conditions of sample acceptability upon receipt? | X | | | | **R1-01** |
| | | **2)** Were all departures from standard conditions described in an exception report? | | | X | | |
| **R2** | OI | **Sample and Quality Control (QC) Identification** | | | | | |
| | | **1)** Are all field sample ID numbers cross-referenced to the laboratory ID numbers? | X | | | | |
| | | **2)** Are all laboratory ID numbers cross-referenced to the corresponding QC data? | X | | | | |
| **R3** | OI | **Test Reports** | | | | | |
| | | **1)** Were all samples prepared and analyzed within holding times? | X | | | | |
| | | **2)** Other than those results < MQL, were all other raw values bracketed by calibration standards? | X | | | | |
| | | **3)** Were calculations checked by a peer or supervisor? | X | | | | |
| | | **4)** Were all analyte identifications checked by a peer or supervisor? | X | | | | |
| | | **5)** Were sample detection limits reported for all analytes not detected? | X | | | | |
| | | **6)** Were all results for soil and sediment samples reported on a dry weight basis? | | | X | | |
| | | **7)** Were % moisture (or solids) reported for all soil and sediment samples? | | | X | | |
| | | **8)** Were bulk soils/solids samples for volatile analysis extracted with methanol per EPA Method 5035? | | | X | | |
| | | **9)** If required for the project, TICs reported? | | | X | | |
| **R4** | O | **Surrogate Recovery Data** | | | | | |
| | | **1)** Were surrogates added prior to extraction? | | | X | | |
| | | **2)** Were surrogate percent recoveries in all samples within the laboratory QC limits? | | | X | | |
| **R5** | OI | **Test Reports/Summary Forms for Blank Samples** | | | | | |
| | | **1)** Were appropriate type(s) of blanks analyzed? | X | | | | |
| | | **2)** Were blanks analyzed at the appropriate frequency? | X | | | | |
| | | **3)** Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures? | X | | | | |
| | | **4)** Were blank concentrations < MDL? | X | | | | |
| | | **5)** For analyte(s) detected in a blank sample, was the concentration, unadjusted for sample specific factors, in all associated field samples, **greater** than 10 times the concentration in the blank sample? | | | X | | |
| **R6** | OI | **Laboratory Control Samples (LCS):** | | | | | |
| | | **1)** Were all COCs included in the LCS? | X | | | | |
| | | **2)** Was each LCS taken through the entire analytical procedure, including prep and cleanup steps? | X | | | | |
| | | **3)** Were LCSs analyzed at the required frequency? | X | | | | |
| | | **4)** Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits? | X | | | | |
| | | **5)** Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SDLs? | X | | | | |
| | | **6)** Was the LCSD RPD within QC limits (if applicable)? | X | | | | |
| **R7** | OI | **Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data** | | | | | |
| | | **1)** Were the project/method specified analytes included in the MS and MSD? | X | | | | |
| | | **2)** Were MS/MSD analyzed at the appropriate frequency? | X | | | | |
| | | **3)** Were MS (and MSD, if applicable) %Rs within the laboratory QC limits? | | X | | | **R7-03** |
| | | **4)** Were MS/MSD RPDs within laboratory QC limits? | X | | | | |
| **R8** | OI | **Analytical Duplicate Data** | | | | | |
| | | **1)** Were appropriate analytical duplicates analyzed for each matrix? | X | | | | |
| | | **2)** Were analytical duplicates analyzed at the appropriate frequency? | X | | | | |
| | | **3)** Were RPDs or relative standard deviations within the laboratory QC limits? | X | | | | |
| **R9** | OI | **Method Quantitation Limits (MQLs):** | | | | | |
| | | **1)** Are the MQLs for each method analyte included in the laboratory data package? | X | | | | |
| | | **2)** Do the MQLs correspond to the concentration of the lowest non-zero calibration standard? | X | | | | |
| | | **3)** Are unadjusted MQLs and DCSs included in the laboratory data package? | X | | | | |
| **R10** | OI | **Other Problems/Anomalies** | | | | | |
| | | **1)** Are all known problems/anomalies/special conditions noted in this LRC and ER? | X | | | | |
| | | **2)** Was applicable and available technology used to lower the SDL to minimize the matrix interference affects on the sample results? | X | | | | |
| | | **3)** Is the laboratory NELAC-accredited under the Texas Laboratory Accreditation Program for the analytes, matrices and methods associated with this laboratory data package? | X | | | | |

|---|---|---|---|---|---|---|---|
| **S1** | OI | **Initial Calibration (ICAL)** | | | | | |
| | | **1)** Were response factors and/or relative response factors for each analyte within QC limits? | X | | | | |
| | | **2)** Were percent RSDs or correlation coefficient criteria met? | X | | | | |
| | | **3)** Was the number of standards recommended in the method used for all analytes? | X | | | | |
| | | **4)** Were all points generated between the lowest and highest standard used to calculate the curve? | X | | | | |
| | | **5)** Are ICAL data available for all instruments used? | X | | | | |
| | | **6)** Has the initial calibration curve been verified using an appropriate second source standard? | X | | | | |
| **S2** | OI | **Initial and Continuing calibration Verification (ICCV and CCV) and Continuing Calibration blank (CCB):** | | | | | |
| | | **1)** Was the CCV analyzed at the method-required frequency? | X | | | | |
| | | **2)** Were percent differences for each analyte within the method-required QC limits? | X | | | | |
| | | **3)** Was the ICAL curve verified for each analyte? | X | | | | |
| | | **4)** Was the absolute value of the analyte concentration in the inorganic CCB < MDL? | X | | | | |
| **S3** | O | **Mass Spectral Tuning:** | | | | | |
| | | **1)** Was the appropriate compound for the method used for tuning? | X | | | | |
| | | **2)** Were ion abundance data within the method-required QC limits? | X | | | | |
| **S4** | O | **Internal Standards (IS):** | | | | | |
| | | **1)** Were IS area counts and retention times within the method-required QC limits? | X | | | | |
| **S5** | OI | **Raw Data (NELAC Section 5.5.10)** | | | | | |
| | | **1)** Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst? | X | | | | |
| | | **2)** Were data associated with manual integrations flagged on the raw data? | X | | | | |
| **S6** | O | **Dual Column Confirmation** | | | | | |
| | | **1)** Did dual column confirmation results meet the method-required QC? | | | X | | |
| **S7** | O | **Tentatively Identified Compounds (TICs):** | | | | | |
| | | **1)** If TICs were requested, were the mass spectra and TIC data subject to appropriate checks? | | | X | | |
| **S8** | I | **Interference Check Sample (ICS) Results:** | | | | | |
| | | **1)** Were percent recoveries within method QC limits? | X | | | | |
| **S9** | I | **Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions** | | | | | |
| | | **1)** Were percent differences, recoveries, and the linearity within the QC limits specified in the method? | | X | | | **S9-09** |
| **S10** | OI | **Method Detection Limit (MDL) Studies** | | | | | |
| | | **1)** Was a MDL study performed for each reported analyte? | X | | | | |
| | | **2)** Is the MDL either adjusted or supported by the analysis of DCSs? | X | | | | |
| **S11** | OI | **Proficiency Test Reports:** | | | | | |
| | | **1)** Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies? | X | | | | |
| **S12** | OI | **Standards Documentation** | | | | | |
| | | **1)** Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources? | X | | | | |
| **S13** | OI | **Compound/Analyte Identification Procedures** | | | | | |
| | | **1)** Are the procedures for compound/analyte identification documented? | X | | | | |
| **S14** | OI | **Demonstration of Analyst Competency (DOC)** | | | | | |
| | | **1)** Was DOC conducted consistent with NELAC Chapter 5 – Appendix C? | X | | | | |
| | | **2)** Is documentation of the analyst's competency up-to-date and on file? | X | | | | |
| **S15** | OI | **Verification/Validation Documentation for Methods** (NELAC Chapter 5) | | | | | |
| | | **1)** Are all the methods used to generate the data documented, verified, and validated, where applicable? | X | | | | |
| **S16** | OI | **Laboratory Standard Operating Procedures (SOPs):** | | | | | |
| | | **1)** Are laboratory SOPs current and on file for each method performed? | X | | | | |

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).

3 NA = Not applicable.

4 NR = Not Reviewed.

5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

# Laboratory Data Package Signature Page – RG-366/TRRP-13

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

R1 Field chain-of-custody documentation;
R2 Sample identification cross-reference;
R3 Test reports (analytical data sheets) for each environmental sample that includes:
  a) Items consistent with NELAC Chapter 5,
  b) dilution factors,
  c) preparation methods,
  d) cleanup methods, and
  e) if required for the project, tentatively identified compounds (TICs).
R4 Surrogate recovery data including:
  a) Calculated recovery (%R), and
  b) The laboratory's surrogate QC limits.
R5 Test reports/summary forms for blank samples;
R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  a) LCS spiking amounts,
  b) Calculated %R for each analyte, and
  c) The laboratory's LCS QC limits.
R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  a) Samples associated with the MS/MSD clearly identified,
  b) MS/MSD spiking amounts,
  c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  d) Calculated %Rs and relative percent differences (RPDs), and
  e) The laboratory's MS/MSD QC limits
R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  a) The amount of analyte measured in the duplicate,
  b) The calculated RPD, and
  c) The laboratory's QC limits for analytical duplicates.
R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix;
R10 Other problems or anomalies.

The Exception Report for each "No" or "Not Reviewed (NR)" item in the Laboratory Review Checklist and for each analyte, matrix, and method for which the laboratory is not accredited under the Texas Laboratory Accreditation Program.

**Release Statement:** I am responsible for the release of this laboratory data package. This laboratory is accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge that all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information or data affecting the quality of the data has been knowingly withheld.

This laboratory was last inspected by TCEQ on February 25-28 2019. Any findings affecting the data in this laboratory data package are noted in the Exception Reports herein. The official signing the cover page of the report in which these data are used is responsible for releasing this data package and is by signature affirming the above release statement is true.

# CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020B - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M2540C - TDS Analysis

Exception Report R1-01

The samples were received and log-in performed on 5/12/20. A total of 7 samples were received. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Anions analysis performed on 5/13/20 (batch 96331) the matrix spikes and matrix spike duplicates recoveries (2005007-01 MS/MSD & 2005077-02 MS/MSD) were out of control limits for Chloride and/or Sulfate. This was due to matrix effect. These are flagged accordingly in the QC summary report. The samples selected for the matrix spikes and matrix spike duplicates were not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 5/20/20 the matrix spike and matrix spike duplicate recoveries were above control limits for Boron. These are flagged accordingly. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Exception Report S9-01

For Metals analysis performed on 5/19/20 the PDS recovery was out of control limits for Calcium. This is flagged accordingly in the QC summary report. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

# ANALYTICAL REPORT

June 10, 2020

## DHL Analytical, Inc.

| | |
|---|---|
| Sample Delivery Group: | L1219695 |
| Samples Received: | 05/18/2020 |
| Project Number: | 2005079 |
| Description: | |

Report To: John DuPont
2300 Double Creek Drive
Round Rock, TX 78664

Entire Report Reviewed By:

Donna Eidson
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Donna Eidson
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDA | Minimum Detectable Activity. |
| Rec. | Recovery. |
| RER | Replicate Error Ratio. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (T) | Tracer - A radioisotope of known concentration added to a solution of chemically equivalent radioisotopes at a known concentration to assist in monitoring the yield of the chemical separation. |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

**APPENDIX B**

# Groundwater Modeling Notes

## APPENDIX B: OAK GROVE GROUNDWATER MODELING NOTES

**By**: William Vienne, Golder
**Date**: March 2021

**Objective:** Create a groundwater model using Visual Modflow to setup steady-state hydrogeological conditions for use in PHREEQC geochemical model.

**Units**

| | | | |
|---|---|---|---|
| length: | feet | pumping rate: | gal/min |
| time: | day | recharge: | in/year |
| concentration: | mg/L | mass: | kg |
| conductivity: | cm/s | | |

**Default Parameters**

| | | | | | |
|---|---|---|---|---|---|
| Kx: | 9E-4 cm/s | | Sy: | 0.22 | (value for sand in Heath 1983) |
| Ky: | 9E-4 cm/s | | eff. Porosity: | 0.25 | (typical of sand aquifer) |
| Kz: | 9E-5 cm/s | | tot. porosity: | 0.40 | (typical of sand aquifer) |
| (K based on 2015 slug tests in wells FGD-5 and FGD-12 (PBW 2017)) | | | SS simulation time : | 1 day | |
| Ss: | 2.3E-4 $ft^{-1}$ | (value for sand in Dominico and Mifflin 1965) | No recharge or evapotranspiration | | |

**Base Map**

Base map: May 2019 groundwater potentiometric surface map

Two-point georeference:

| Model Coordinates | Georeferenced Coordinates |
|---|---|
| Model origin (0, 0 ft) | N11321403/E2419094 |
| MW-8R | N11326288/E2423313 |

**Model Setup**

3 layers:

1. Upper sandy silt/clay: Ground surface to 405 feet amsl (thickness varies with ground elevation -- generally ~20 feet thick)
 - Kxy = 1E-4 cm/s; Kz = 1E-5 cm/s
 - All other hydro parameters set to default values
 - All ponds are completed in Layer 1
2. Middle sand (uppermost GWBU): 405 feet amsl to 370 feet amsl
 - All monitoring wells are completed in Layer 2
 - All hydro parameters set to default values, including conductivity
 - Kxy = 9E-4 cm/s; Kz = 9E-5 cm/s
3. Lower confining clay: 370 feet amsl to 360 feet amsl
 - Kxy = 1E-5 cm/s; Kz = 1E-6 cm/s
 - All other hydro parameters set to default values

Model extent: 9000 ft x 9000 ft

| Columns | Rows | |
|---|---|---|
| 90 | 90 | (100-ft grid cells) |

- Refined cells to 50 ft in FGD Area
- Generated ground surface elevation grid using well ground surface elevations
 - Imported excel file with model coordinates and elevations. Used Natural Neigbor function for interpolation.
 - Adjusted ground elevation of single cells in Layer 1 around FGD Ponds to reflect berm heights on engineer drawings (Pond-A = 450', Pond-B = 430', Pond-C = 455').
 - Set interior pond areas to the berm elevations (allows use of Lake package for ponds)

**Boundary Conditions**

- Constant head boundary or 420 feet set in Layer 2 along western edge of Ash Landfill 1 based on water elevations in wells in that area.

- Constant head boundary of 410 feet set in Layer 2 for Twin Oak Reservoir. Did not use Lake package because primary concern is leakage from ponds, not the reservoir. Normal level of lake is 401 feet, but 410 feet matched better with May 2019 groundwater elevation contours.
- Constant head boundaries created gw gradient similar to the one shown on May 2019 pot map, with groundwater flowing toward reservoir.
- Lake Package used for ponds FGD-A, B, and C. Assumed constant water levels of 10 feet above bottom of ponds. Pond bottoms based on engineering drawings. Lake Package parameters:

| Pond ID | Start | Stop (days) | Lake Stage (ft amsl) | Bottom (ft amsl) | Precip | Runoff | Evap | Lake Bed (ft) | K of Lake Bed (cm/s) |
|---|---|---|---|---|---|---|---|---|---|
| A | 0 | 10950 | 432 | 422 | 0 | 0 | 0 | 3 | 1E-06 |
| B | 0 | 10950 | 428 | 418 | 0 | 0 | 0 | 3 | 1E-06 |
| C | 0 | 10950 | 449 | 439 | 0 | 0 | 0 | 3 | 1E-06 |

**Calibration**

Model vs.Observed Head in CCR wells (May 2019):
Residual Mean: 0.135 ft
Standard Error of the Estimate: 0.367 ft
Correlation Coefficient: 0.873

**Deliverables for PHREEQC Model**

1. VMOD head files (x, y, z, and head)
2. Surface elevation grid
3. Shapefile showing pond outlines

# 1.0 INTRODUCTION

On behalf of Oak Grove Management Company (Luminant), Golder Associates, Inc. (Golder), Member of WSP, has prepared this Tier IV Monitored Natural Attenuation (MNA) Performance Monitoring Plan for the FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") located at the Oak Grove Steam Electric Station (OGSES) in Robertson County, Texas (hereafter, the "Site"). Luminant manages coal combustion residuals (CCR) in the FGD Ponds, which are subject to applicable requirements of 40 Code of Federal Regulations (CFR) Part 257 Subpart D as amended (CCR Final Rule).

Statistically significant levels (SSLs) of cobalt and lithium above groundwater protection standards (GWPSs) were detected in the uppermost aquifer hydraulically downgradient of the FGD Ponds during 2018 assessment monitoring. In response to the 2018 cobalt and lithium SSLs, an Assessment of Corrective Measures (ACM) report was completed for the FGD Ponds in September 2019 as required by 40 CFR § 257.96 (Golder 2019). The ACM demonstrated that groundwater concentrations of cobalt and lithium were stable or decreasing at all wells and the extent of cobalt and lithium SSLs was delineated on-site (i.e., no offsite migration was indicated). An Alternate Source Demonstration (ASD) was completed in accordance with 40 CFR § 257.95(g)(3)(ii) in October 2020 (Golder 2020), which indicated that a source other than the FGD Ponds caused the lithium SSL. Lithium has therefore been eliminated as a constituent of concern at the FGD Ponds. The ACM was updated in May 2021 (Golder 2021a) to remove lithium from the list of constituents evaluated in the ACM.

As documented in the Remedy Selection Report for the FGD Ponds (Golder 2021b), MNA in conjunction with source control measures (i.e., retrofitting the liner in FGD-A Pond) was selected as the remedy to address cobalt SSLs at the Site. MNA refers to the reliance on natural attenuation processes (within the context of a carefully controlled and monitored approach) to achieve site-specific groundwater remediation objectives. MNA relies on a range of natural processes, including sorption, (co)precipitation, radioactive decay, dispersion, dilution, and abiotic degradation/transformation to achieve remediation objectives. A Tier I MNA evaluation report was completed in December 2019 (Golder 2019b) and a Tier II/III MNA evaluation report was completed in June 2021 (Golder 2021c). Based on the results of these MNA evaluations, the following was concluded regarding cobalt:

- Physical and chemical attenuation of cobalt is occurring at the Site. Cobalt levels are stable and the aquifer has adequate capacity to attenuate cobalt in a reasonable timeframe. Modeling indicates that cobalt attenuation will be efficient and stable in the long term. Cobalt in the CCR unit porewater is well below the level that is observed in groundwater, including when a periodic exceedance occurs in downgradient groundwater. Therefore, MNA would be effective in remediating cobalt in groundwater beneath and downgradient of the FGD Ponds.

The purpose of this Tier IV MNA Performance and Monitoring Plan is to describe the groundwater monitoring network, sampling and analysis methods, procedures for assessing long-term MNA effectiveness, and reporting for the MNA monitoring program.

# 2.0 SITE SETTING

The OGSES is located approximately 10 miles north of the city of Franklin in Robertson County, Texas. The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (**Figure 1**). Construction of the OGSES began in the mid-1980s; however, plant construction was suspended in the mid-1980s prior to completion. OGSES construction resumed in 2007 and the plant was commissioned in 2010. The OGSES is expected to remain in operation for the foreseeable future, depending on future power demands.

## 2.1 Site Hydrogeology and CCR Monitoring Well Network

The OGSES is located in the outcrop area of the Eocene-aged Wilcox Group (Barnes 1970), which is divided into three formations in the region: the Calvert Bluff, Simsboro, and Hooper Formations (in order from youngest to oldest). The FGD Ponds are completed in the Calvert Bluff Formation, which consists of unconsolidated to moderately consolidated clay and silt, with various amounts of interbedded sand and lignite.

Based on soil borings completed at the Site, the geology near the FGD Ponds generally consists of an upper zone of relatively thick, interbedded sand and clay strata underlain by a lower zone of interbedded silty to clayey sand and well sorted sand (PBW 2017). The uppermost groundwater-bearing unit (GWBU) occurs under unconfined conditions within the shallow interbedded sand units of the Calvert Bluff Formation. Groundwater elevations have generally been highest southeast of the FGD Ponds and relatively flat in the vicinity of the FGD Ponds. Since CCR monitoring began in 2015, the inferred groundwater flow direction at the Site has been to the east-northeast toward Twin Oak Reservoir, which borders the FGD Pond area to the north and east.

The CCR groundwater monitoring well network at the FGD Ponds was established in 2015 using Site monitoring wells screened in the uppermost GWBU (FGD-1, FGD-2, FGD-3, FGD-4, FGD-5, FGD-6, FGD-8, FGD-11, and FGD-12). A map of the CCR groundwater monitoring network is provided on **Figure 1**.

# 3.0 CCR GROUNDWATER SAMPLING AND ANALYSIS PROGRAM

The CCR Rule establishes groundwater sampling and analysis criteria that are designed to create consistency and ensure that monitoring results provide accurate representations of groundwater quality at the CCR groundwater monitoring wells. The groundwater monitoring program at the FGD Ponds consists of a combination of detection monitoring of Appendix III constituents in accordance with 40 CFR §257.94 and assessment monitoring of Appendix IV constituents in accordance with 40 CFR §257.95. The current CCR groundwater monitoring program includes the sampling and analysis of cobalt (an Appendix IV constituent) and satisfies the sampling and analysis requirements of the MNA monitoring program.

# 4.0 MNA MONITORING PROGRAM

Routine groundwater monitoring is required to verify that the MNA component of the selected Site remedy is achieving the site-specific groundwater remediation objectives. The MNA monitoring well network will be the same as the CCR monitoring network, and includes the CCR wells listed in Section 2.1 and shown on **Figure 1**. The assessment monitoring program groundwater samples, which are collected semi-annually, will be used to assess the effectiveness of the MNA remedy in addressing SSLs observed at the Site.

## 4.1 MNA Groundwater Sampling Procedures

This section describes groundwater sampling and analysis procedures to comply with the requirements of 40 CFR §257.90 - §257.95 of the CCR Rule and to additionally satisfy requirements of the MNA monitoring program.

### 4.1.1 General Groundwater Sampling Procedures

Prior to collecting groundwater samples, each well is inspected for signs of damage to the well protective casing and well pad. Each field instrument is calibrated according to the manufacturer's instructions prior to use. Special care should be exercised to prevent contamination of the groundwater and extracted samples during the sampling activities. The primary way in which such contamination can occur is contact with improperly cleaned equipment. To prevent such contamination, all non-dedicated sampling equipment is thoroughly cleaned before and between use at different sampling locations.

### 4.1.2 Groundwater Level Measurements

Groundwater levels are measured prior to purging the wells. Using a pre-cleaned water level meter, the groundwater surface is measured from the casing datum to the nearest 0.01-foot. Total depth measurements should also be collected periodically to assess potential occlusion of the well screen.

### 4.1.3 Well Purging and Sampling

Well purging and sampling are conducted using either a submersible pump, peristaltic pump, or other similar device in accordance with standard low-flow sampling procedures. The sampler withdraws water in a manner that minimizes stress (drawdown) to the system to the extent practicable. When the pump intake is located within the screened interval, the water pumped is drawn in directly from the formation with little mixing of casing water or disturbance to the sampling zone. Thus, sample results are more representative of the constituents present in the groundwater than when pumping at higher rates.

Purging rates during sample collection are generally performed at 0.5 liters per minute (L/min) or less. Field parameters (pH, temperature, conductivity, turbidity, dissolved oxygen (DO), and oxidation-reduction potential (ORP)) are measured to evaluate when the well is adequately purged. pH, DO, and ORP are also considered key MNA parameters important for evaluating geochemical conditions in the groundwater-bearing unit. Turbidity in the samples should be minimized as much as possible by using minimal pumping rates, dedicated equipment whenever possible, and positioning the intake for the sample tubing or submersible pump off of the bottom of the well.

At least three field measurements should be taken during the course of purging the well. If the parameters have not stabilized at that time, field measurements and purging will continue until two consecutive readings have stabilized to within the following limits:

- Temperature: +/-1° C
- pH: +/-0.1 pH units
- Conductivity: +/-10%
- Turbidity: +/- 10%
- Dissolved oxygen: +/- 10%
- Oxidation-reduction potential: +/- 10%

Sample extraction is accomplished by using the pump that was previously used to purge the well. The sample bottle is filled directly from the pump line. The pumping rate and parameter measurements are recorded on groundwater sampling forms in the field. If a well goes dry during purging, sampling is performed after the well has sufficiently recharged to allow sample collection. Groundwater samples are not filtered in the field prior to collection in accordance with Section 257.93(i) of the CCR Rule.

### 4.1.4 Chain-of-Custody Control

Samples are collected in laboratory-supplied containers and chain-of-custody procedures are followed to establish a written record concerning sample movement between the sampling site and the testing laboratory. Each shipping container has a chain-of-custody form completed by the sampling personnel packing the samples. The chain-of-custody form for each container is completed and sealed in the shipping container.

## 4.2 MNA Analytical Procedures

The laboratory analytical methods are appropriate and commonly utilized U.S. Environmental Protection Agency (EPA) methodologies, or other similar standard methodologies. Typical methodologies used to analyze the MNA constituents are presented below:

- Cobalt by EPA Method SW6010/6020 (evaluated during each MNA sampling event).
- General geochemical parameters (evaluated periodically):
  - Major cations: calcium, magnesium, potassium, and sodium by EPA Method SW6010/6020;
  - Major anions: chloride and sulfate by Standard Method E300; and
  - Alkalinity (bicarbonate, carbonate, hydroxide, and total) by Standard Method M2320.

## 4.3 MNA Data Assessment

The MNA monitoring program is a long-term performance monitoring program designed to confirm concentration reductions and document trends due to attenuation mechanisms. The MNA program will assess the effectiveness of the remedy by:

- Evaluating whether cobalt concentrations are present in groundwater at SSLs above the GWPS.
- Evaluating long-term trends in cobalt concentrations in CCR wells where SSLs have been identified to demonstrate that the groundwater plume is stable or decreasing and not expanding; and
- Evaluating geochemical parameters measured in the field (e.g., pH, DO, and ORP) during each sampling event and periodically collecting the general geochemistry parameter data listed in Section 4.2 to assess changes to the general geochemical conditions of the aquifer.

Per 40 CFR §257.98(c), the selected remedy will be considered complete when: (1) The owner or operator of the CCR unit demonstrates compliance with the GWPS established under 40 CFR § 257.95(h) has been achieved at all points within the plume of contamination that lie beyond the groundwater monitoring well system established under 40 CFR § 257.91, (2) Compliance with the GWPS established under 40 CFR § 257.95(h) has been achieved by demonstrating that concentrations of constituents listed in appendix IV to this part have not exceeded the GWPSs for a period of three consecutive years using the statistical procedures and performance standards in 40 CFR § 257.93(f) and (g), and (3) All actions required to complete the remedy have been satisfied.

## 4.4 Reporting

A summary of the MNA data assessment will be included in the *Annual Groundwater Monitoring and Corrective Action Report* each year. The report will: 1) confirm whether the groundwater plume is stable, shrinking, or expanding; 2) contain data summaries including Appendix III and Appendix IV constituent concentrations and geochemical data summaries, and 3) evaluate the general effectiveness of attenuation processes with trend analysis and other statistical evaluations of the data, as appropriate.

# 1.0 INTRODUCTION

## 1.1 Purpose

The "Standards for Disposal of Coal Combustion Residuals (CCR) in Landfills and Surface Impoundments" (40 Code of Federal Regulations (40 CFR) Part 257, Subpart D), effective October 19, 2015, requires that existing CCR units have a written Closure Plan prepared in accordance with §257.102(b). This Closure Plan provides the following information for the Oak Grove Steam Electric Station's (OGSES's) CCR landfill identified as Ash Landfill 1.

- A description of steps necessary to close CCR unit and any point during the active life, including:
  - A description of how CCR unit will be closed;
  - A description of how the final cover will meet the performance standards§257.102(d), and the methods used to install the final cover;
  - An estimate of maximum inventory of CCR ever on-site during the active life of the CCR unit;
  - An estimate of largest area requiring final cover at any time during the CCR unit's active life; and
  - A schedule, including steps, major milestones, durations.

LUMINANT

## 1.2 Site Background

The OGSES generates bottom ash, fly ash, boiler slag and flue gas desulfurization (FGD) sludge (gypsum) during electricity generation. Flyash and bottom ash generated at the facility (other than that amount that is sold/beneficially used in accordance with the CCR regulation), is handled in a dry manner and deposited in Ash Landfill 1.

This Closure Plan addresses the existing CCR landfill, Ash Landfill 1, at the OGSES. A separate Closure Plan addresses the existing CCR surface impoundments (FGD-A, FGD-B, and FGD-C Ponds).

The location of the existing CCR units at the OGSES are shown on Figure 1.

## 2.0 DESCRIPTION OF CLOSURE [§257.102(b)(1)(i)]

Ash Landfill 1 will be closed in-place and capped with a final cover system. Cell 1 of Ash Landfill 1 received final closure in 2015.

## 2.1 Final Cover System [§257.102(b)(1)(iii)]

Ash Landfill 1 is lined with a 3-foot thick compacted clay with a hydraulic conductivity less than 1 x $10^{-7}$ cm/sec and the remainder of the cells will be closed with an alternate final cover meeting the requirements of §257.102(d)(3)(ii)(A) through (C)[1]. Specifically, the final cover system over Ash Landfill 1 will:

- Achieve an equivalent reduction in infiltration as §257.102(d)(3)(i)(A) and (B); i.e.
  - Have a permeability less than or equal to the permeability of bottom liner system or natural subsoils or no greater than 1 x $10^{-5}$ cm/sec, whichever is less;
  - Include an infiltration layer with a minimum 18 inches of earthen material;
- Include an erosion layer providing equivalent protection from wind or water erosion as specified in §257.102(d)(3)(i)(C); i.e.
  - Include an erosion layer containing a minimum 6 inches of earthen material and capable of sustaining native plant growth; and
- Accommodate settling and subsidence.

LUMINANT

The final cover system for Ash Landfill 1 will be comprised of (from the top to bottom):

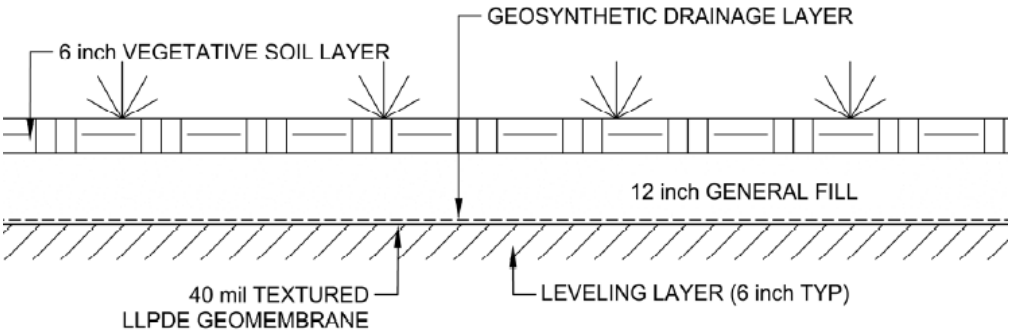
- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation;
- Geosynthetic drainage layer; and
- 40-mil linear low-density polyethylene (LLDPE) textured geomembrane.

The proposed alternate final cover replaces the soil infiltration layer with a geomembrane. Since infiltration is limited to potential defects in the geomembrane, the infiltration through the proposed cover will be lower than through a soil infiltration layer. A comparison of infiltration rates to demonstrate that an equivalent reduction in infiltration is included in Appendix A.

The final cover system for Ash Landfill 1 is illustrated below.

[1] The CCR Rule references (f)(3)(ii)(A) through (D), but this appears to be a typo.

**Ash Landfill 1 Final Cover System**



### 2.1.1 Final Cover Design and Performance

Table 1 describes how the final cover system meet the performance standards in §257.102(d).

**Table 1 - Performance Standards**

| Standard | Discussion |
|---|---|
| Control, minimize or eliminate post-closure infiltration, releases of CCR, leachate, or contaminated run-off | Geomembranes are very effective barriers to infiltration and contact with CCR. Liquid will be removed from the CCR prior to final cover construction. |
| Preclude future impoundment of water sediment, or slurry | Any pipes leading to the landfill will be removed or abandoned and the final cover will be sloped to drain surface water. |
| Include measures for major slope stability | The textured geomembrane will improve interface shear strength and the geosynthetic drainage layer will prevent development of hydrostatic forces in the overlying erosion layer. |
| Minimize maintenance | Routine maintenance will consist of mowing the vegetative cover. Other anticipated maintenance activities are limited to repair of erosion rills, and placement of fill in depressions. |
| Complete in time consistent with good practice | The proposed final cover systems is routinely used at waste containment facilities. Well-developed industry experiences in installing such final cover systems will ensure most efficient construction time. |

LUMINANT

### 2.1.2 Methods and Procedures

The final cover system design, particularly the final cover grades, will be re-evaluated prior to initiation of final closure, based on the actual CCR grades at the time of closure. The final cover will be installed in accordance with a construction quality assurance (CQA) plan, which will be developed prior to commencing the work. The CQA plan will require monitoring of final cover construction to ensure that the final cover system will meet the design intent and conforms to the performance standards.

As described in Section 4.3 of the Closure Plan, a certification that the final cover system meets the requirements of §257.102(d)(3)(iii) will be provided by a qualified professional engineer, prior to initiation of final closure.

LUMINANT

## 3.0 CCR QUANTITY [§257.102(b)(1)(iv-v)]

The approximate capacity of Ash Landfill 1 is 15.6 million cubic yards.

Final cover was placed over Cell 1 of Ash Landfill 1 in 2015. It is anticipated that Cell 2 will be closed in 2017. The remaining cells, Cells 3 and 4, are anticipated to reach capacity in approximately 2023. The final cover for these two cells cover an area of approximately 68 acres, which represents the largest area of the CCR unit ever requiring final cover.

LUMINANT

## 4.0 CLOSURE COMPLETION SCHEDULE [§257.102(b)(1)(vi)]

As mentioned above, Ash Landfill 1 is anticipated to reach capacity in 2023 and completion all closure activities are anticipated to occur in 2023-2024. Note that these estimates may vary depending on the future CCR volumes and the other operational factors.

### 4.1 Commencement of the Closure Plan [§257.102(e)]

In accordance with §257.102(e), commencement of the Closure Plan will occur as specified in either timeframe defined below:

- No later than 30 days after the date on which either:
  - The CCR unit receives the known final receipt of waste; or
  - The last known CCR is removed for beneficial use.

- Within 2 years of either:
  - The CCR unit last receives waste; or
  - The last CCR is removed for beneficial use.

LUMINANT

Initiation of closure work may be extended two years with documentation in accordance with §257.102(e)(2)(ii) that there is reasonable likelihood that the CCR unit will accept wastes in the foreseeable future or CCR will be removed from the unit for beneficial use.

Closure of a CCR unit has commenced if waste placement has ceased and any of the following are completed (§257.102(e)(3)):

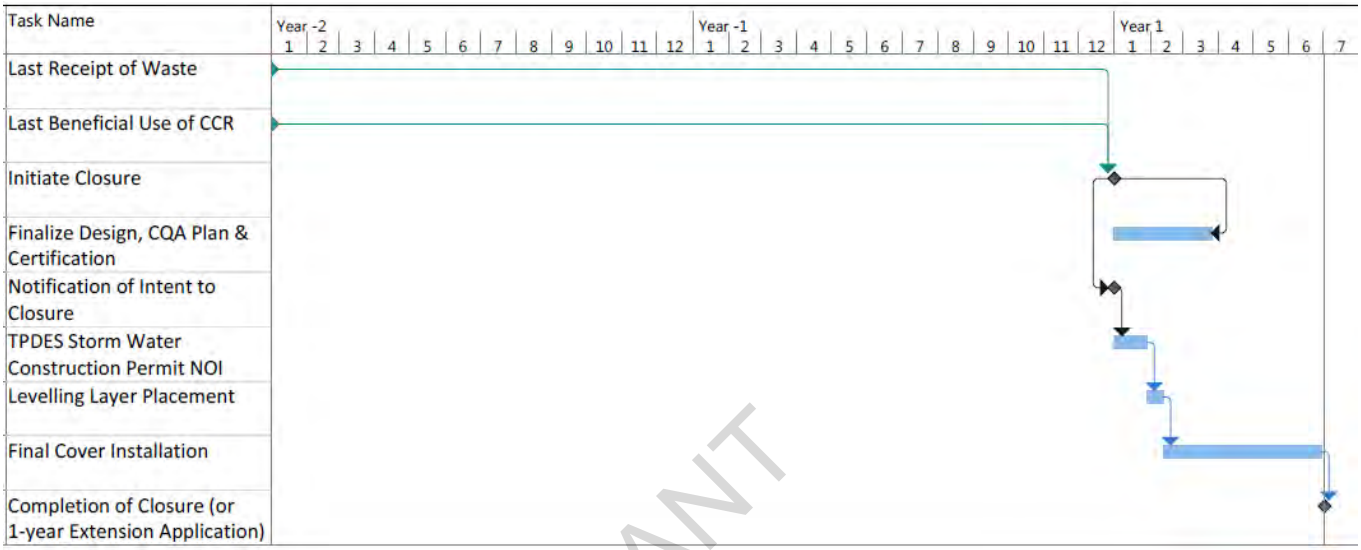
- Taken any steps necessary to implement steps in the Closure Plan;
- Submitted a completed application for any required state or agency permit or permit modification; or
- Taken any steps necessary to comply with prerequisite state standards to initiate or complete the closure of a CCR unit.

### 4.2 Completion of Closure Activities [§257.102(f)]

Closure of Ash Landfill 1 must be completed within 6 months of commencing closure. Completion of closure may be extended up to a maximum of 2 years via 1-year increments with documentation in accordance with §257.102(f)(2)(i) that, due to factors beyond the facility's control (e.g. significant weather delays, time required for dewatering CCR, delays due to state permitting or approval, etc.), it is not feasible to complete the closure within the required timeframe. An extension may also apply if the alternative closure requirements should apply to the CCR units in accordance with §257.103.

A Gantt chart illustrating the sequential steps of the CCR unit closure process, including identification of major milestones and estimated timeframes to complete each closure phase, is provided below.

**Final Closure Schedule**



LUMINANT

### 4.2.1 *Closure Certification*

A certification from a qualified professional engineer verifying that closure has been completed in accordance with the Closure Plan must be obtained in accordance with §257.102(f)(3).

## 4.3 Notification of Intent to Close CCR Unit [§257.102(g)]

No later than the date of final closure initiation, a notification of intent to close the CCR unit must be prepared. The notification must include certification by a qualified professional engineer that the final cover system meets the requirements of §257.102(d)(3)(i) or (ii).

## 4.4 Notification of Closure Completion [§257.102(h)]

No later than 30 days after of completion of closure, a notification of closure of a CCR unit must be prepared. The notification must include certification by a qualified professional engineer that closure was completed in accordance with the Closure Plan.

## 4.5 Deed Notations [§257.102(i)]

Following closure of the CCR unit, a certified notation on the deed to the facility or site property, or on some other instrument that is normally examined during title searches, that will in perpetuity notify any potential purchaser of the property that the land has been used as a CCR unit and that future uses of the land are

restricted will be filed and recorded in the deed records of the office of the County Clerk of Robertson County.

A notification will be placed in the facilities operating record within 30 days of recording a notation to the deed to the property.

## 4.6 Closure Recordkeeping [§257.102(j)]

The owner or operator of the CCR unit must comply with the closure recordkeeping requirements specified in §257.105(i), the closure notification requirements specified in §257.106(i), and the closure internet requirements specified in §257.107(i).

LUMINANT

## 5.0 CONCLUSION

This Final Closure Plan has been prepared by Golder Associates Inc. to describe the steps necessary to close the existing Ash Landfill 1 at OGSES at any point during the active life of the CCR unit with recognized and generally accepted good engineering practices.

If further information from Golder, please contact the undersigned at (281) 821-6868.

# CALCULATIONS

| | | | |
|---|---|---|---|
| **Date:** | 9/26/2016 | **Made by:** | JBF |
| **Project No.:** | 1648164 | **Checked by:** | MX |
| **Subject:** | Alternate Final Cover - Infiltration Rate Comparison | **Reviewed by:** | JBF |
| **Project Short Title:** | OGSES - Landfill Final Cover Plan | | |

## OBJECTIVE

Compare the infiltration rate through a "prescriptive" final cover system with the infiltration rate through the alternate final cover system proposed for use in Ash Landfill 1.

## GIVEN

The prescriptive final cover infiltration layer consists of a minimum 18-inch thick layer of earthen material with a permeability less than or equal to the permeability of the bottom liner. Ash Landfill 1was lined with a clay layer with a permeability of $1 \times 10^{-7}$ cm/s. The alternate final cover system will replace the earthen material infiltration layer with a geomembrane. In addition, the proposed alternate final cover includes a geosynthetic drainage layer above the geomembrane.

## METHOD

Estimate the infiltration rate through the earthen material infiltration layer using Darcy's equation. Estimate the infiltration through the geomembrane infiltration layer using the Giroud Equation (Ref. 1). Compare the infiltration rate through earthen material infiltration layer to the geomembrane infiltration layer.

**Infiltration Through 18-inch earthen Infiltration Layer**

Darcy's Equation

$Q = kiA$

where:

- Q = Leakage rate
- k = hydraulic conductivity
- i = hydraulic gradient = (h+t)/t
- h= head
- t = thickness
- A = area

Infiltration Layer Properties

| | | |
|---|---|---|
| k = | 1.00E-07 | cm/s |
| t = | 1.5 | ft |
| h = | 0.5 | ft (erosion layer saturated) |
| i = | 1.33 | |
| A = | 1 | acre |

**Q = 123 gal/acre/day**

LUMINANT

# CALCULATIONS

| | | | |
|---|---|---|---|
| **Date:** | 9/26/2016 | **Made by:** | JBF |
| **Project No.:** | 1648164 | **Checked by:** | MX |
| **Subject:** | Alternate Final Cover - Infiltration Rate Comparison | **Reviewed by:** | JBF |
| **Project Short Title:** | OGSES - Landfill Final Cover Plan | | |

**Infiltration through geomembrane**

Giroud's Equation Ref 1

$Q = C[1+0.1(h/t_s)^{0.95}]a^{0.1}h^{0.9}k_s^{0.74}$

where:

C = 0.21 for good contact
1.15 for poor contact

h = head (m)

$t_s$ = thickness of underlying soil component (i.e. grading layer) (m)

a = area of hole ($m^2$)

$k_s$ = hydraulic conductivity of underlying soil (m/s)

Geomembrane & Subgrade Properties

| | | |
|---|---|---|
| C = | 1.15 | (conservative) |
| h = | 0.2 | in (approximate thickness of drainage layer) |
| $t_s$ = | 0.5 | ft |
| a = | 1 | $cm^2$ (equivalent to a 0.44 inch diameter hole - conservative) |
| $k_s$ = | 1.00E-03 | cm/s (conservative for site soils) |
| Number of Defects = | 2 | per acre (conservative for good installation quality) |

**Q =** 1.58E-06 $m^3$/sec/acre
**36 gal/acre/day**

LUMINANT

## CONCLUSION

Based on this analysis, the infiltration rate through a geomembrane final cover system will be less than the infiltration through a 1.5-ft thick infiltration layer with permeability of 1 x $10^{-7}$ cm/s.

# DOCUMENT REVISION RECORD

| Issue No. | Date | Details of Revisions |
|---|---|---|
| **Revision 0** | October 2016 | Original Document |
| **Addendum 1** | November 2022 | Added confirmation that landfill cap slope stability will be modeled using site-specific geotechnical data during final closure design |

# 1.0 INTRODUCTION

On behalf of Oak Grove Management Company LLC (Luminant), WSP Golder (Golder) has prepared this Addendum No. 1 to the Closure Plan for Ash Landfill 1(ALF1) located at the Oak Grove Steam Electric Station (OGSES) in Robertson County, Texas (hereafter, the "Site"). Coal Combustion Residuals (CCR) including flue gas desulfurization (FGD) wastewater and bottom ash generated as part of OGSES operation are managed in ALF1. ALF1 is regulated as an Existing CCR Landfill under 40 C.F.R. § 257, Subpart D (the "CCR Rule").

The original Closure Plan for ALF1 was prepared in October 2016 in accordance with 40 C.F.R. §257.102(b) and placed in the OGSES operating record in accordance with 40 C.F.R. §257.105(h)(10) (Golder, 2016). This Addendum No. 1 updates the Closure Plan to reflect the following:

- Confirmation that the slope stability of the ALF1 cap/cover system will be modeled using site-specific geotechnical data during design of the final closure of the landfill.

## 2.0 LANDFILL CAP/COVER SYSTEM SLOPE STABILITY MODELING

ALF 1 is the primary disposal facility for CCR generated at the OGSES and consists of four landfill cells (Cells 1 through 4), each constructed with a 3-foot thick compacted clay liner (hydraulic conductivity ≤ $1\times10^{-7}$ cm/sec). The landfill is constructed above-grade and is surrounded by earthen perimeter berms that extend 10 to 20 feet or more above ground surface. The perimeter berms are also provided with a 3-foot thick compacted clay liner on the interior face of the berms.

A final cap/cover system will be constructed over the CCR in ALF1 as part of unit closure as described in the 2016 Closure Plan (Golder, 2016). The final cover system for ALF1 as described in the 2016 Closure Plan consisted of the following (from bottom to top):

- Minimum 6 inches of select fill on top of CCR to serve as levelling layer/cap subgrade;
- 40-mil linear low-density polyethylene (LLDPE) textured geomembrane;
- Geosynthetic drainage layer; and
- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation.

The ALF1 Closure Plan will be updated to include cap/cover system slope stability modeling using site-specific geotechnical data during design of the final cap/closure system for the landfill.

Appendix A Alternate Final Cover – Infiltration Rate Comparison

# 1.0 INTRODUCTION

## 1.1 Purpose

The "Standards for Disposal of Coal Combustion Residuals (CCR) in Landfills and Surface Impoundments" (40 Code of Federal Regulations (40 CFR) Part 257, Subpart D), effective October 19, 2015, requires that existing CCR units have a written Closure Plan prepared in accordance with §257.102(b). This Closure Plan provides the following information for the Oak Grove Steam Electric Station's (OGSES's) CCR Impoundments identified as flue gas desulphurization (FGD) Ponds FGD-A, FGD-B, and FGD-C.

- A description of steps necessary to close CCR unit at any point during the active life of the CCR unit, including:
  - A description of how CCR unit will be closed;
  - A description of how the final cover will meet the performance standards §257.102(d), and the methods and procedures used to install the final cover;
  - An estimate of maximum inventory of CCR ever on-site during the active life of the CCR unit;
  - An estimate of largest area requiring final cover at any time during the CCR unit's active life; and
  - A schedule, including steps, major milestones, durations.

LUMINANT

## 1.2 Site Background

The OGSES generates bottom ash, fly ash, boiler slag and flue gas desulfurization (FGD) sludge (gypsum) during electricity generation. The following surface impoundments, shown on Figure 1, are in operation at the OGSES:

- FGD-A Pond;
- FGD-B Pond; and
- FGD-C Pond.

The Closure Plan addresses the existing CCR surface impoundments at the OGSES. A separate Closure Plan addresses the existing ash landfill (Ash Landfill 1).

## 2.0 DESCRIPTION OF CLOSURE [§257.102(b)(1)(i)]

The existing surface impoundments at the OGSES will be closed in-place and capped with a final cover system. The final cover design will vary depending on the existing lining system within the CCR surface impoundment. The components of the final cover for each CCR surface impoundment are presented in Section 2.3.

The final cover grades will depend on conditions present at closure. Conceptual final cover grades are presented on Figure 2.

### 2.1 Removal of Liquid and Stabilization of CCR [§257.102(d)(2)]

Prior to construction of the final cover, the surface impoundments will be dewatered by constructing dewatering sumps and actively pumping liquid from the impoundments. Free liquids removed from the impoundments will be managed in accordance with applicable regulations.

It is anticipated that, once dewatered, CCR within the surface impoundments will have sufficient strength properties to accommodate and support the proposed closure grades. If the dewatered CCR materials do not have the strength to accommodate earthwork equipment and/or fill material required to meet the closure grades, then the CCR material will be stabilized as necessary prior to closure construction.

Inlet pipes along the crest of the surface impoundments will be removed. Below-grade inlet and outlet pipes will be abandoned by filling with grout, “flowable fill” or other methods.

LUMINANT

### 2.2 Grading Layer

A grading layer will be placed over the dewatered/stabilized CCR material to achieve closure grades. The grading layer will be placed below the final cover system to allow the final cover systems described in this section to meet the grades as shown on Figure 2 – Final Cover Grading Plan,. Once the grading layer has been placed to its design grades, the final cover system will be installed.

Based on an evaluation of the contents of FGD-A (Golder, 2013), the CCR material consists predominantly of silt-size particles with 5 to 40% sand and typically less than 10% clay (< 5 microns). Once fill placement begins, Golder anticipates some consolidation of the CCR will occur; but expects that the majority of the settlement will occur during or shortly after closure construction (due to the noncohesive nature of the CCR and fill materials), thus, limiting long term subsidence.

### 2.3 Final Cover System [§257.102(b)(1)(iii)]

The components of the final cover system will depend on the existing liner system within the CCR surface impoundment. As described in the following sections, the final cover system in FGD-A will differ from the final cover system in FGD-B and FGD-C.

### 2.3.1 FGD-B & C Ponds Final Cover Design

FGD-B and FGD-C Ponds are lined with a composite liner system (consisting of a 2-foot thick compacted clay liner with a hydraulic conductivity (k) of 1 x $10^{-7}$ cm/sec or less, and a 60-mil high density polyethylene (HDPE) geomembrane) and will be closed with a composite final cover system meeting the requirements of §257.102(d)(3)(i)(A) through (D). Specifically, the final cover system over FGD-B and FGD-C Ponds will:

(A) Have a permeability less than or equal to the permeability of bottom liner system or natural subsoils or no greater than 1 x $10^{-5}$ cm/sec, whichever is less;

(B) Include an infiltration layer with a minimum 18 inches of earthen material;

(C) Include an erosion layer containing a minimum 6 inches of earthen material and capable of sustaining native plant growth; and

(D) Accommodate settling and subsidence.

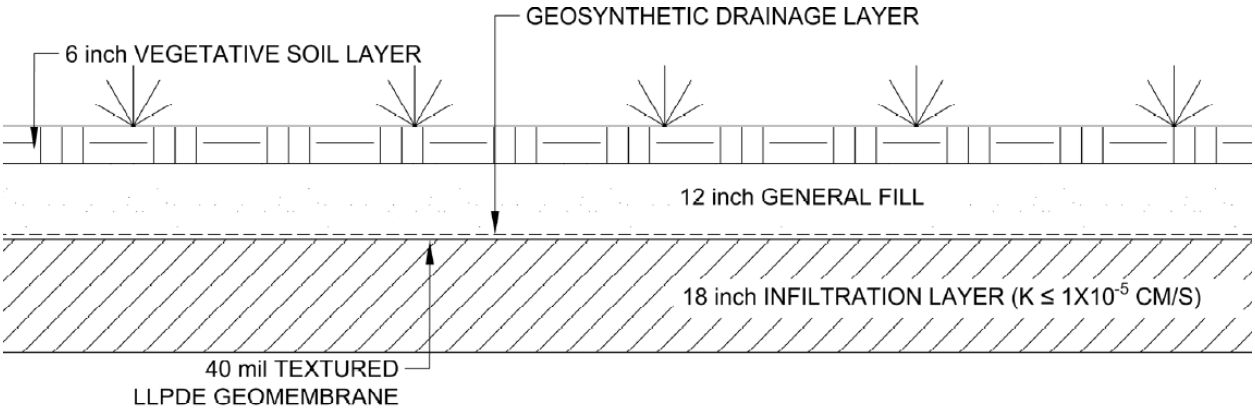
The final cover system for FGD-B and FGD-C will be comprised of (from the top to bottom):

- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation;
- Geosynthetic drainage layer;
- 40-mil linear low-density polyethylene (LLDPE) textured geomembrane; and
- 18-inch thick soil infiltration layer with a permeability of 1 x $10^{-5}$ cm/sec or less.

The final cover system for FGD-B and FGD-C is illustrated below.

LUMINANT

**Final Cover System – FGD-B & FGD-C**



### 2.3.2 FGD-A Pond Final Cover Design

FGD-A Pond is lined with a 3-foot thick compacted clay with a hydraulic conductivity less than 1 x $10^{-7}$ cm/sec and will be closed with an alternate final cover meeting the requirements of §257.102(d)(3)(ii)(A) through (C)[1]. Specifically, the final cover system over FGD-A Pond will:

- Achieve an equivalent reduction in infiltration as §257.102(d)(3)(i)(A) and (B) (See Section 2.3.1 above);
- Include an erosion layer providing equivalent protection from wind or water erosion as specified in §257.102(d)(3)(i)(C); and
- Accommodate settling and subsidence.

The final cover system for FGD-A will be comprised of (from the top to bottom):

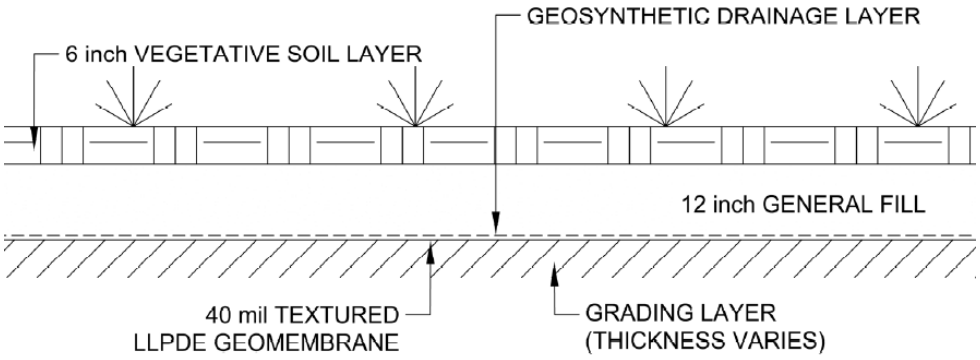
- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation;
- Geosynthetic drainage layer; and
- 40-mil linear low-density polyethylene (LLDPE) textured geomembrane.

LUMINANT

The proposed alternate final cover replaces the soil infiltration layer with a geomembrane. Since infiltration is limited to potential defects in the geomembrane, the infiltration through the proposed cover will be lower than through a soil infiltration layer. A comparison of infiltration rates to demonstrate that an equivalent reduction in infiltration is included in Appendix A.

The final cover system for FGD-A Pond is illustrated below.

**Final Cover System – FGD-A Pond**



[1] The CCR Rule references (f)(3)(ii)(A) through (D), but this appears to be a typo.

### 2.3.3 Final Cover Design and Performance

Table 1 describes how the final cover systems meet the performance standards in §257.102(d).

**Table 1 - Performance Standards**

| Standard | Discussion |
|---|---|
| Control, minimize or eliminate post-closure infiltration, releases of CCR, leachate, or contaminated run-off | Geomembranes are very effective barriers to infiltration and contact with CCR. Liquid will be removed from the CCR prior to final cover construction. |
| Preclude future impoundment of water sediment, or slurry | The pipes leading to the surface impoundments will be removed or abandoned and the final cover will be sloped to drain surface water. |
| Include measures for major slope stability | The textured geomembrane will improve interface shear strength and the geosynthetic drainage layer will prevent development of hydrostatic forces in the overlying erosion layer. |
| Minimize maintenance | Routine maintenance will consist of mowing the vegetative cover. Other anticipated maintenance activities are limited to repair of erosion rills, and placement of fill in depressions. |
| Complete in time consistent with good practice | Both proposed final cover systems are routinely used at waste containment facilities. Well-developed industry experiences in installing such final cover systems will ensure most efficient construction time. |

LUMINANT

### 2.3.4 Methods and Procedures

The final cover system design, particularly the final cover grades, will be re-evaluated prior to initiation of final closure, based on the actual CCR grades at the time of closure. As discussed in Section 2.1, the strength properties of the CCR materials present at that time will be evaluated and addressed in the final design of the final cover system and an amended closure plan. The final cover will be installed in accordance with a construction quality assurance (CQA) plan, which will be developed prior to commencing the work. The CQA plan will require monitoring of final cover construction to ensure that the final cover system will meet the design intent and conforms to the performance standards.

As described in Section 4.3 of this Closure Plan, a certification that the final cover system meets the requirements of §257.102(d)(3)(iii) will be provided by a qualified professional engineer, prior to initiation of final closure.

## 3.0 CCR QUANTITY AND AREA [§257.102(b)(1)(iv-v)]

For the purposes of this closure plan, in-place closure of CCR within the surface impoundments is based on the assumed volume of CCR (solids) being limited to 50 percent of the total capacity of the impoundment. The final cover surface area will be approximately equal to the total area within the crest of the surface impoundment as listed in Table 2.

The approximate maximum CCR volume and maximum final cover area over the active life of the CCR unit for each surface impoundment are summarized in Table 2.

**Table 2 – Approximate CCR Volume and Area**

| Surface Impoundment | Total Capacity (acre-ft) | CCR Volume (cy) | Final Cover Area (acre) |
|---|---|---|---|
| FGD-A | 172 | 138,500 | 9.0 |
| FGD-B | 104 | 83,500 | 11.2 |
| FGD-C | 218 | 176,000 | 15.2 |

LUMINANT

## 4.0 CLOSURE COMPLETION SCHEDULE [§257.102(b)(1)(vi)]

The timeframe for initiation final closure of the CCR units depends on several factors and is unknown; therefore, the year in which all closure activities will be completed is unknown.

## 4.1 Commencement of the Closure Plan [§257.102(e)]

In accordance with §257.102(e), commencement of this Closure Plan will occur as specified in either timeframe defined below:

- No later than 30 days after the date on which either:
  - The CCR unit receives the known final receipt of waste; or
  - The last known CCR is removed for beneficial use.

- Within 2 years of either:
  - The CCR unit last receives waste; or
  - The last CCR is removed for beneficial use.

Initiation of closure work may be extended two years with documentation in accordance with §257.102(e)(2)(ii) that there is reasonable likelihood that the CCR unit will accept wastes in the foreseeable future or CCR will be removed from the unit for beneficial use.

Closure of CCR unit has commenced if waste placement has ceased and any of the following are completed (§257.102(e)(3)):

- Taken any steps necessary to implement steps in the Closure Plan;
- Submitted a completed application for any required state or agency permit or permit modification; or
- Taken any steps necessary to comply with prerequisite state standards to initiate or complete the closure of a CCR unit.

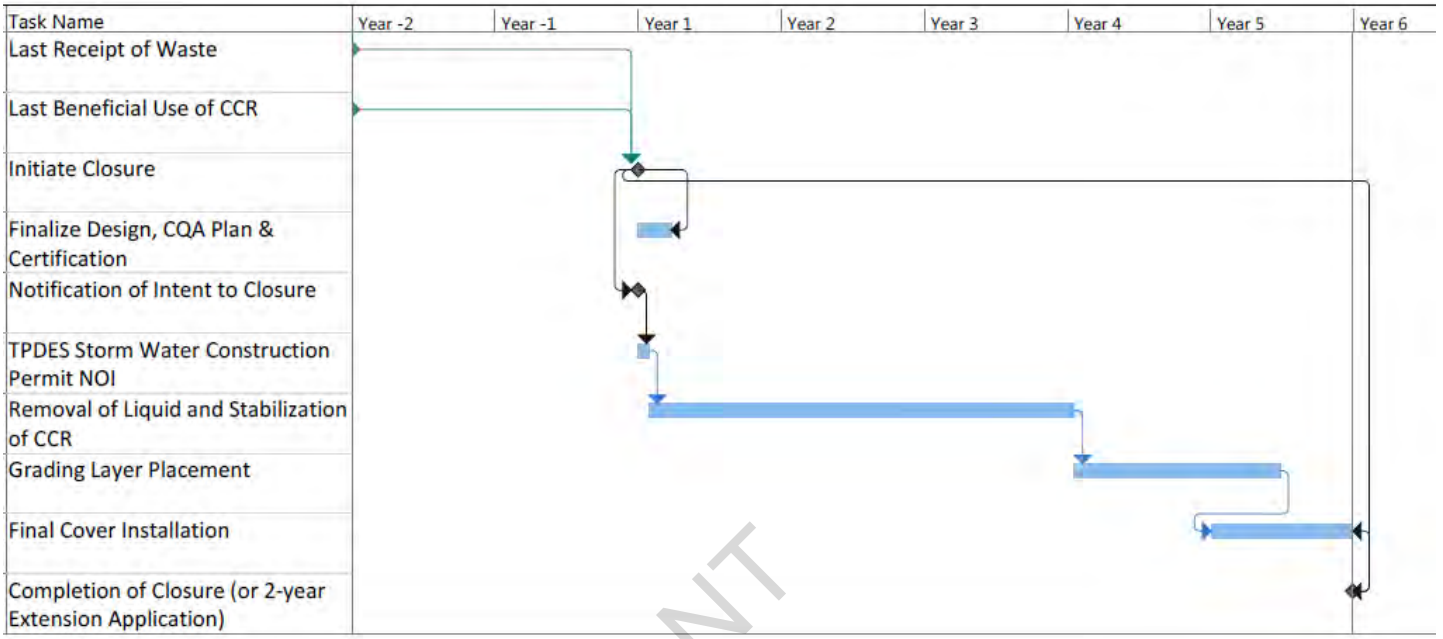
## 4.2 Completion of Closure Activities [§257.102(f)]

Closure of each surface impoundment must be completed within 5 years of commencing closure. Completion of closure may be extended 2 years with documentation in accordance with §257.102(f)(2)(i) that, due to factors beyond the facility's control (e.g. significant weather delays, time required for dewatering CCR, delays due to state permitting or approval, etc.), it is not feasible to complete the closure within the required timeframe. An extension may also apply if the alternative closure requirements should apply to the CCR units in accordance with §257.103.

A Gantt chart illustrating the sequential steps of the CCR closure process, including identification of major milestones and estimated timeframes to complete each closure phase, is provided below.

LUMINANT

**Final Closure Schedule**



LUMINANT

### *4.2.1 Closure Certification*

A certification from a qualified professional engineer verifying that closure has been completed in accordance with the Closure Plan must be obtained in accordance with §257.102(f)(3).

## 4.3 Notification of Intent to Close CCR Unit [§257.102(g)]

No later than the date of final closure initiation, a notification of intent to close the CCR unit must be prepared. The notification must include certification by a qualified professional engineer that the final cover system meets the requirements of §257.102(d)(3)(i) or (ii).

## 4.4 Notification of Closure Completion [§257.102(h)]

No later than 30 days after of completion of closure, a notification of closure of a CCR unit must be prepared. The notification must include certification by a qualified professional engineer that closure was completed in accordance with the Closure Plan.

## 4.5 Deed Notations [§257.102(i)]

Following closure of the CCR unit, a certified notation on the deed to the facility or site property, or on some other instrument that is normally examined during title searches, that will in perpetuity notify any potential purchaser of the property that the land has been used as a CCR unit and that future uses of the land are restricted will be filed and recorded in the deed records of the office of the County Clerk of Robertson County.

A notification will be placed in the facilities operating record within 30 days of recording a notation to the deed to the property.

## 4.6 Closure Recordkeeping [§257.102(j)]

The owner or operator of the CCR unit must comply with the closure recordkeeping requirements specified in §257.105(i), the closure notification requirements specified in §257.106(i), and the closure internet requirements specified in §257.107(i).

LUMINANT

## 5.0 CONCLUSION

This Final Closure Plan has been prepared by Golder Associates Inc. to describe the steps necessary to close the existing CCR surface impoundments at OGSES at any point during the active life of the units with recognized and generally accepted good engineering practices.

If further information from Golder, please contact the undersigned at (281) 821-6868.

# APPENDIX A
# ALTERNATE FINAL COVER – INFILTRATION RATE COMPARISON

LUMINANT

# CALCULATIONS

| | | | |
|---|---|---|---|
| **Date:** | 9/26/2016 | **Made by:** | JBF |
| **Project No.:** | 1648164 | **Checked by:** | MX |
| **Subject:** | Alternate Final Cover - Infiltration Rate Comparison | **Reviewed by:** | JBF |
| **Project Short Title:** | OGSES - SI Final Cover Plan | | |

## OBJECTIVE

Compare the infiltration rate through a "prescriptive" final cover system with the infiltration rate through the alternate final cover system proposed for use in FGD-A Pond.

## GIVEN

The prescriptive final cover infiltration layer consists of a minimum 18-inch thick layer of earthen material with a permeability less than or equal to the permeability of the bottom liner. FGD-A was lined with a clay layer with a permeability of $1 \times 10^{-7}$ cm/s. The alternate final cover system will replace the earthen material infiltration layer with a geomembrane. In addition, the proposed alternate final cover includes a geosynthetic drainage layer above the geomembrane.

## METHOD

Estimate the infiltration rate through the earthen material infiltration layer using Darcy's equation. Estimate the infiltration through the geomembrane infiltration layer using the Giroud Equation (Ref. 1). Compare the infiltration rate through earthen material infiltration layer to the geomembrane infiltration layer.

**Infiltration Through 18-inch earthen Infiltration Layer**

Darcy's Equation

$Q = kiA$

where:

- Q = Leakage rate
- k = hydraulic conductivity
- i = hydraulic gradient = (h+t)/t
- h= head
- t = thickness
- A = area

Infiltration Layer Properties

| | | |
|---|---|---|
| k = | 1.00E-07 | cm/s |
| t = | 1.5 | ft |
| h = | 0.5 | ft (erosion layer saturated) |
| i = | 1.33 | |
| A = | 1 | acre |

**Q = 123 gal/acre/day**

LUMINANT

# CALCULATIONS

| | | | |
|---|---|---|---|
| **Date:** | 9/26/2016 | **Made by:** | JBF |
| **Project No.:** | 1648164 | **Checked by:** | MX |
| **Subject:** | Alternate Final Cover - Infiltration Rate Comparison | **Reviewed by:** | JBF |
| **Project Short Title:** | OGSES - SI Final Cover Plan | | |

**Infiltration through geomembrane**

Giroud's Equation Ref 1

$Q = C[1+0.1(h/t_s)^{0.95}]a^{0.1}h^{0.9}k_s^{0.74}$

where:

C = 0.21 for good contact
1.15 for poor contact

h = head (m)

$t_s$ = thickness of underlying soil component (i.e. grading layer) (m)

a = area of hole ($m^2$)

$k_s$ = hydraulic conductivity of underlying soil (m/s)

Geomembrane & Subgrade Properties

| | | |
|---|---|---|
| C = | 1.15 | (conservative) |
| h = | 0.2 | in (approximate thickness of drainage layer) |
| $t_s$ = | 1 | ft (conservative) |
| a = | 1 | $cm^2$ (equivalent to a 0.44 inch diameter hole - conservative) |
| $k_s$ = | 1.00E-03 | cm/s (conservative for site soils) |
| Number of Defects = | 2 | per acre (conservative for good installation quality) |

**Q =** 1.58E-06 $m^3$/sec/acre
**36 gal/acre/day**

LUMINANT

## CONCLUSION

Based on this analysis, the infiltration rate through a geomembrane final cover system will be less than the infiltration through a 1.5-ft thick infiltration layer with permeability of 1 x $10^{-7}$ cm/s.

# DOCUMENT REVISION RECORD

| Issue No. | Date | Details of Revisions |
|---|---|---|
| **Revision 0** | October 2016 | Original Document |
| **Addendum 1** | November 2022 | Revised configuration of final cap/cover system for FGD-A and added confirmation that cap slope stability will be modeled using site-specific geotechnical data during final closure design |

# 1.0 INTRODUCTION

On behalf of Oak Grove Management Company LLC (Luminant), WSP Golder (Golder) has prepared this Addendum No. 1 to the Closure Plan for FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") located at the Oak Grove Steam Electric Station (OGSES) in Robertson County, Texas (hereafter, the "Site"). Coal Combustion Residuals (CCR) including flue gas desulfurization (FGD) wastewater and bottom ash generated as part of OGSES operation are managed in the FGD Ponds. The FGD Ponds are regulated as Existing CCR Impoundments under 40 C.F.R. § 257, Subpart D (the "CCR Rule").

The original Closure Plan for the FGD Ponds was prepared in October 2016 in accordance with 40 C.F.R. §257.102(b) and placed in the OGSES operating record in accordance with 40 C.F.R. §257.105(h)(10) (Golder, 2016). This Addendum No. 1 updates the Closure Plan to reflect the following:

- Revisions to the configuration of the final cap/cover system for FGD-A due to a retrofit of the FGD-A liner system; and
- Confirmation that the slope stability of FGD Pond cap/cover systems will be modeled using site-specific geotechnical data during design of the final closure of the impoundments.

# 2.0 FGD POND CAP/COVER SYSTEMS AND SLOPE STABILITY MODELING

The FGD Ponds are constructed above grade and are surrounded by engineered earthen dikes that extend to approximately 25 feet above surrounding ground level. A final cap/cover system will be constructed over the CCR in the FGD Ponds as part of unit closure as described in the 2016 Closure Plan (Golder, 2016).

The final cover system for FGD-B and FGD-C described in the 2016 Closure Plan consisted of the following (from bottom to top):

- 18-inch thick soil infiltration layer with a permeability of 1 x $10^{-5}$ cm/sec or less;
- 40-mil linear low-density polyethylene (LLDPE) textured geomembrane;
- Geosynthetic drainage layer; and
- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation.

A different final cover system configuration was proposed for FGD-A in the 2016 Closure Plan. The final cap/cover system for FGD-A has been revised to be similar to the cap/cover systems for FGD-B and FGD-C due to a retrofit of the FGD-A liner system. The final cap/cover system for FGD-A will now consist of the following (from bottom to top):

- 18-inch thick soil infiltration layer with a permeability of 1 x $10^{-5}$ cm/sec or less;
- 40-mil LLDPE textured geomembrane;
- Geosynthetic drainage layer; and
- 18-inch erosion layer consisting of 12 inches of general fill overlain with 6 inches of soil capable of supporting native vegetation.

The proposed final cap/cover systems for FGD-A, FGD-B and FGD-C comply with the requirements of 40 C.F.R. §257.102(d)(3)(i)(A) through (D):

(A) Have a permeability less than or equal to the permeability of bottom liner system or natural subsoils or no greater than 1 x $10^{-5}$ cm/sec, whichever is less;

(B) Include an infiltration layer with a minimum 18 inches of earthen material;

(C) Include an erosion layer containing a minimum 6 inches of earthen material and capable of sustaining native plant growth; and

(D) Accommodate settling and subsidence.

The FGD Pond Closure Plan will be updated to include cap/cover system slope stability modeling using site-specific geotechnical data during design of the final cap/closure systems for the FGD Ponds.

# 1.0 INTRODUCTION

## 1.1 Purpose

The "Disposal of Coal Combustion Residuals (CCR) from Electric Utilities rule" (40 Code of Federal Regulations (40 CFR) Part 257), effective October 19, 2015, requires that existing CCR units closed in accordance with §257.102 must meet the requirements of §257.104 – Post-closure care requirements. In accordance with §257.104(d), this Post-Closure Plan provides the following information for the Oak Grove Steam Electric Station's (OGSES's) CCR landfill identified as Ash Landfill 1.

- A description of the required post-closure monitoring and maintenance activities and the frequency at which these activities will be performed;
- The name, address, telephone number, and email address of the person or office to contact about the facility during the post-closure care period; and
- A description of the planned uses of the closed unit property during the post-closure period. Post-closure use of the property must not disturb the integrity of the final cover, liner, or any other component of the unit containment system, or the function of the monitoring systems.

Post-closure care must be conducted for 30 years after the CCR unit has been closed.

## 1.2 Site Background

The OGSES generates bottom ash, fly ash, boiler slag and flue gas desulfurization (FGD) sludge (gypsum) during electricity generation. Flyash and bottom ash generated at the facility (other than that amount that is sold/beneficially used in accordance with the CCR regulation), is handled in a dry manner and deposited in Ash Landfill 1.

The Post-Closure Plan addresses the existing CCR landfill at the OGSES. A separate Post-Closure Plan addresses the existing surface impoundments (FGD-A Pond, FGD-B Pond, and FGD-C Pond).

LUMINANT

## 2.0 POST-CLOSURE MONITORING AND MAINTENANCE PLAN [§257.104(d)(1)(i)]

Monitoring and maintenance activities will be performed to maintain the integrity and effectiveness of the final cover system as specified in §257.104(b)(1). During the post-closure monitoring and maintenance period of the site, the final cover of the closed CCR unit will be inspected at the frequency indicated in Table 1 below.

**Table 1 – Post-Closure Care Maintenance**

| Post-Closure Care Maintenance Item | Frequency of Inspections | Types of Deficiency Conditions to be looked for during inspections |
|---|---|---|
| Final Cover Condition | Annually | Inspection for vegetation, erosion, settlement, ponding water, and functionality and the surface water drainage system |
| Vegetation | Annually | Erosion rills and depressions, vegetative stress |
| Drainage structures | Annually | Sediment and debris build up, component damage, blockages, erosion, ponding of water in non-designated areas, excessive vegetative growth |

Each monitoring and maintenance activity will be documented and include the date, components and items monitored, name of the individual performing the monitoring/maintenance, a description of the deficiencies observed (if any), maintenance/repairs performed (if any), and related information.

At a minimum, maintenance will be performed as needed prior to the next scheduled inspection.

LUMINANT

## 3.0 GROUNDWATER MONITORING

As specified in 257.104(b)(3), groundwater monitoring activities will continue throughout the post-closure care period in accordance with §257.90 through §257.98. All groundwater monitoring wells that are part of the groundwater monitoring network will be monitored and maintained during the post-closure care period in accordance with the Groundwater Sampling and Analysis Plan, which will be finalized and placed in the Operating Record by October 17, 2017.

If at the end of the 30-year post-closure care period, groundwater assessment monitoring is being performed at the unit in accordance with §257.95, post-closure care of the unit must continue until the unit has returned to groundwater detection monitoring under §257.95.

LUMINANT

## 5.0 POST-CLOSURE LAND USE [§257.104(d)(1)(iii)]

Post-closure use of the property will not disturb the integrity of the final cover, liner system, or any other component of the containment system, or function of the monitoring system in accordance with §257.104(d)(1)(iii) unless necessary to comply with the maintenance requirements of this subpart or as otherwise provided as allowed under this subpart.

Post-closure land use is anticipated to be undeveloped/unchanged and the area will be deed recorded and deed restricted to prevent disturbance of the closed waste management unit.

LUMINANT

## 6.0 NOTIFICATION OF COMPLETION OF POST-CLOSURE CARE PERIOD [§257.104(E)]

No later than 60 days following completion of the post-closure care period, a certification will be prepared by a qualified professional engineer verifying that the post-closure care has been completed in accordance with this Post-Closure Plan.

LUMINANT

## 7.0 CONCLUSION

This Post-Closure Plan has been prepared by Golder Associates Inc., to describe post-closure monitoring and maintenance activities, to provide contact information, and to describe land use after the post-closure period.

# 1.0 INTRODUCTION

## 1.1 Purpose

The "Disposal of Coal Combustion Residuals (CCR) from Electric Utilities rule" (40 Code of Federal Regulations (40 CFR) Part 257), effective October 19, 2015, requires that existing CCR units closed in accordance with §257.102 must meet the requirements of §257.104 – Post-closure care requirements. In accordance with §257.104(d), this Post-Closure Plan provides the following information for the Oak Grove Steam Electric Station's (OGSES's) CCR Impoundments identified as flue gas desulphurization (FGD) Ponds FGD-A, FGD-B, and FGD-C.

- A description of the required post-closure monitoring and maintenance activities and the frequency at which these activities will be performed;
- The name, address, telephone number, and email address of the person or office to contact about the facility during the post-closure care period; and
- A description of the planned uses of the closed unit property during the post-closure period. Post-closure use of the property must not disturb the integrity of the final cover, liner, or any other component of the unit containment system, or the function of the monitoring systems.

Post-closure care must be conducted for 30 years after the CCR unit has been closed.

## 1.2 Site Background

The OGSES generates bottom ash, fly ash, boiler slag and flue gas desulfurization (FGD) sludge (gypsum) during electricity generation. The following surface impoundments, shown on Figure 1, are in operation at the OGSES:

- FGD-A Pond;
- FGD-B Pond; and
- FGD-C Pond.

The Post-Closure Plan addresses the existing CCR surface impoundments at the OGSES. A separate Post-Closure Plan addresses the existing ash landfill (Ash Landfill 1).

LUMINANT

## 2.0 POST-CLOSURE MONITORING AND MAINTENANCE PLAN [§257.104(d)(1)(i)]

Monitoring and maintenance activities will be performed to maintain the integrity and effectiveness of the final cover system as specified in §257.104(b)(1). During the post-closure monitoring and maintenance period of the site, the final cover of the closed CCR unit will be inspected at the frequency indicated in Table 1 below.

**Table 1: Post-Closure Care Maintenance**

| Post-Closure Care Maintenance Item | Frequency of Inspections | Types of Deficiency Conditions to be looked for during inspections |
|---|---|---|
| Final Cover Condition | Annually | Inspection for vegetation, erosion, settlement, ponding water, and functionality and the surface water drainage system |
| Vegetation | Annually | Erosion rills and depressions, vegetative stress |
| Drainage structures | Annually | Sediment and debris build up, component damage, blockages, erosion, ponding of water in non-designated areas, excessive vegetative growth |

Each monitoring and maintenance activity will be documented and include the date, components and items monitored, name of the individual performing the monitoring/maintenance, a description of the deficiencies observed (if any), maintenance/repairs performed (if any), and related information.

At a minimum, maintenance will be performed as needed prior to the next scheduled inspection.

LUMINANT

## 3.0 GROUNDWATER MONITORING

As specified in 257.104(b)(3), groundwater monitoring activities will continue throughout the post-closure care period in accordance with §257.90 through §257.98. All groundwater monitoring wells that are part of the groundwater monitoring network will be monitored and maintained during the post-closure care period in accordance with the Groundwater Sampling and Analysis Plan, which will be finalized and placed in the Operating Record by October 17, 2017.

If at the end of the 30-year post-closure care period, groundwater assessment monitoring is being performed at the unit in accordance with §257.95, post-closure care of the unit must continue until the unit has returned to groundwater detection monitoring under §257.95.

## Post-Closure Care Cost Estimate

# TECHNICAL MEMORANDUM

**DATE** October 28, 2022 **Project No.** 31404097.007

**TO** Mr. Eric Chavers
Luminant

**FROM** Patrick J. Behling, PE/Will Vienne, PG **EMAIL Patrick.Behling@wsp.com**

**OAK GROVE POWER PLANT**
**FGD PONDS AND ASH LANDFILL 1**
**POST CLOSURE CARE COST ESTIMATES**

Oak Grove Management Company LLC (Oak Grove) owns and operates the Oak Grove Steam Electric Station (OGSES) located approximately ten miles north of Franklin in Robertson County, Texas. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operation. The CCRs are managed at the FGD Ponds (FGD-A, FGD-B and FGD-C) and Ash Landfill 1 (ALF1).

These CCR Units are regulated under 40 CFR 257, Subpart D (the "Federal CCR Rule") and 30 Texas Administrative Code (TAC) Chapter 352 (The "TCEQ CCR Rule"). In accordance with 30 TAC §352.201, Luminant is required to submit an application to TCEQ to obtain a registration for each of these CCR Units. WSP Golder (Golder) has been retained by Luminant to assist with preparation of Post Closure Care Cost Estimates (PCCEs) for the FGD Ponds and ALF1 in accordance with §352.1101. This technical memorandum presents the PCCEs estimated by Golder for these units. The PCCEs were prepared using TCEQ Technical Guidance Documents TG-30 and TG-31 and related documents.

## 1.0 CCR Unit Closure Assumptions

The PCCEs were prepared based on the following closure assumptions for the OGSES CCR Units:

- FGD Ponds:
  - FGD-A, FGD-B and FGD-C managed as one CCR Unit
  - CCR Unit Closure:
    - Closure in Place with vegetated, low permeability cap
    - Cap Areas:
      - FGD-A Cap Area: 9 acres
      - FGD-B Cap Area: 11.2 acres
      - FGD-C Cap Area: 15.2 acres
      - Total: 35.4 acres
  - Groundwater Closure:
    - Monitored Natural Attenuation (MNA) with MNA Groundwater Monitoring
    - Continuation of Detection and Assessment Monitoring for Groundwater
    - Nine (9) monitoring wells sampled semi-annually
- Ash Landfill 1:
  - CCR Unit Closure:
    - Closure in Place with vegetated, low permeability cap
    - Cap Area: 128 acres

- Groundwater Closure:
  - No evidence of a release to groundwater to date
  - Continuation of Detection Monitoring for Groundwater
  - Six (6) monitoring wells sampled semi-annually

## 2.0 Post Closure Care Cost Assumptions

The following general assumptions were incorporated into the PCCEs:

- Post Closure Care Period. A post-closure care period of 30 years is assumed in accordance with 30 TAC §352.1241 and 40 CFR § 257.104(c).
- CCR Unit Inspections. Weekly and annual inspections of the CCR Units are required under §352.831 and §352.841. It is assumed that these inspections will continue throughout the Post Closure Care Period.
- Final Cover Maintenance. It is likely that some level of maintenance/repair will be required for the final cover systems used to close the CCR Units. The PCCEs include the following assumptions for final cover maintenance/repair:
  - Years 1-5 After Closure - it is assumed that erosion damage on 5% of the cap soil will be repaired each year. The thickness of each repair is assumed to average 6 inches of soil. In addition, the repaired areas will be revegetated.
  - Years 6-30 After Closure - it is assumed that erosion damage on 5% of the cap soil will be repaired three times during this period. The thickness of each repair is assumed to average 6 inches of soil. In addition, the repaired areas will be revegetated.
  - Estimated engineering/mobilization costs associated with the repairs/revegetation are included in the PCCEs.
  - Annual mowing costs for the final cover are included in the PCCEs.
- General Site Maintenance. Maintenance of run-off/drainage structures, access roads, fencing, signs, etc. are included in the PCCEs.
- Groundwater Monitoring. Semi-annual groundwater monitoring in accordance with the Federal/TCEQ CCR Rules (detection monitoring or assessment monitoring) is on-going for the units. It is assumed that the current groundwater monitoring program will continue throughout the Post Closure Care Period. It is also likely that maintenance of the monitoring well system at the units will be required during the post closure care period. The PCCEs assume that one monitoring well will be replaced every 10 years at each CCR Unit.

  In addition, the FGD Ponds incorporate MNA as a groundwater remedy as part of closure. For these CCR Units, it is assumed that MNA analyses will be included in the semi-annual groundwater monitoring events.
- One Time Post Closure Care Costs. The following on time activities associated with post closure care are included in the PCCEs:
  - Deed Notices/Surveys
  - Monitoring Well Plugging and Abandonment
- Contingency. A 10% contingency factor is included in the PCCEs.
- All costs are in 2021 dollars.

## 3.0 Post Closure Care Cost Estimate

Based on the assumptions listed above, the 30-Year post closure care cost estimates for the OGSES CCR Units are as follows (see Tables 1 and 2 for details):

- FGD Ponds: $2,168,817
- Ash Landfill 1: $2,326,837

It should be noted that the PCCEs presented herein are considered Opinions of Probable Cost and represent Golder's best judgement based on the assumptions stated, information available at the time the estimates were prepared, and Golder's experience with similar sites. The PCCEs are susceptible to variations in future cost of materials, labor, and equipment and should not be considered guaranteed maximum prices for post closure care activities.

Please do not hesitate to contact us if you have any questions or comments.

# TABLES

**Table 1**

**Oak Grove Steam Electric Station - FGD Ponds**
**Post Closure Care Cost Estimate - 30 TAC 352.1101**

| Item | Unit | Rate | Quantity | Cost/Event | No. of Events | 30-Year Cost |
|---|---|---|---|---|---|---|
| CCR Unit Inspections (Annually) | LS | $15,000 | 1 | $15,000 | 30 | $450,000 |
| Final Cover Maintenance | | | | | | |
| - Erosion Repair, 6-inch avg. thickness, 5% of cap per year, Years 1-5 | CY | $5 | 1,428 | $7,139 | 5 | $35,695 |
| - Erosion Repair, 6-inch avg. thickness, 5% of cap, 3 times, Years 6-30 | CY | $5 | 1,428 | $7,139 | 3 | $21,417 |
| - Revegetation, 5% of cap area per year, Years 1-5 | AC | $1,500 | 1.8 | $2,655 | 5 | $13,275 |
| - Revegetation, 5% of cap area, 3 times, Years 6-30 | AC | $1,500 | 1.8 | $2,655 | 3 | $7,965 |
| - Engineering/Mobilization for Final Cover Repairs/Revegetation Events | LS | $10,000 | 1 | $10,000 | 8 | $80,000 |
| - Mowing, per year | AC | $150 | 35 | $5,310 | 30 | $159,300 |
| General Site Maintenance (Annually) | | | | | | |
| - Run-off/Drainage Structures | LS | $2,000 | 1 | $2,000 | 30 | $60,000 |
| - Access Roads, fencing, signs, etc. | LS | $1,000 | 1 | $1,000 | 30 | $30,000 |
| GW Monitoring (Annually) | | | | | | |
| - Detection Monitoring - Semi-annual Collection/Analysis, (9 MWs, 1 Dup) | EA | $500 | 10 | $5,000 | 60 | $300,000 |
| - Assessment Monitoring - Semi-annual Analysis, (9 MWs, 1 Dup) | EA | $350 | 10 | $3,500 | 60 | $210,000 |
| - MNA Monitoring - Semi-annual Analysis, (9 MWs, 1 Dup) | EA | $200 | 10 | $2,000 | 60 | $120,000 |
| - Annual Report (Including MNA) | LS | $15,000 | 1 | $15,000 | 30 | $450,000 |
| - Monitoring Well Maintenance (1 MW replaced every 10 years) | EA | $5,000 | 1 | $5,000 | 3 | $15,000 |
| One Time Post Closure Care Costs | | | | | | |
| - Deed Notices/Surveys | LS | $10,000 | 1 | $10,000 | 1 | $10,000 |
| - Monitoring Well Plugging and Abandonment | EA | $1,000 | 9 | $9,000 | 1 | $9,000 |
| | | | | | Subtotal 30-Year Post Closure Care Costs: | $1,971,652 |
| | | | | | Contingency (10%): | $197,165 |
| | | | | | **30-Year Post Closure Cost Estimate:** | **$2,168,817** |

**Notes:**
1. All Costs in 2021 Dollars
2. SY - square yard
3. CY - cubic yard
4. EA - each
5. AC - acre
6. M - month
7. Gal - gallons
