ASTM D 5084 METHOD [illegible], CONSTANT VOLUME - FALLING HEAD

| | | | | | |
|---|---|---|---|---|---|
| PROJECT TITLE: | Luminant/Oak Grove FGD-B CQA/TX | | Cell Pressure = | 80 | psi |
| PROJECT NUMBER: | 113-94788.1 | | Backwater Pressure = | 70 | psi |
| SAMPLE ID: | CL-337 | | Run Number = | 1 | |
| LIFT NUMBER: | Lift 4 | | | | |

| **Sample Data, Initial** | | inches |
|---|---|---|
| Height, cm | 9.22 | 3.63 |
| Diameter, cm | 7.21 | 2.840 |
| Area, $cm^2$ | 40.87 | |
| Volume, $cm^3$ | 376.82 | |
| Wet Mass, g | 755.8 | |
| Wt. wet soil + tare, gm | 201.70 | |
| Wt. dry soil + tare, gm | 166.80 | |
| Wt. tare, gm | 10 | |
| Moisture Content, % | 22.3% | |
| Dry Density, pcf | 102.4 | |
| Specific Gravity | 2.66 | |
| Void Ratio | 0.62 | |
| Saturation, % | 95.3% | |
| Effective Stress, psi | 10 | |

**Initial Manometer Readings**

Pipette = 27.7

Annulus = 0.35

**Calculation Constants:**

**Manometer Constants:**

$M_1$ = 0.03 $cm^2$

$M_2$ = 1.04

**Sample Constants:**

S = 0.23 $cm^{-1}$

**Specific Gravity Constant:**

G = 12.56

**Test Constant:**

C = 0.0005

$T = M_2/z_1$

where $z_1$ = Pipette reading - annulus reading for each time step

| **Sample Data, Final** | | inches |

Notes:
1. In situ values determined by nuclear methods: ASTM D-2922 for density and D-3017 for moisture content.
2. "PASS" indicates both a percent compaction exceeding the minimum required compaction (95% Max Dry Density) and a moisture content above the optimum moisture content.

Notes:
1. In situ values determined by nuclear methods: ASTM D-2922 for density and D-3017 for moisture content.
2. "PASS" indicates a percent compaction exceeding the minimum required compaction (95% Max Dry Density).

# CLAY LINER FIELD DENSITY TEST SUMMARY
## LUMINANT POWER
## OAK GROVE SES
## FGD-B POND
## ROBERTSON COUNTY, TEXAS

| Test Number | Date | Location | | Lift | In Situ Values (1) | | Reference Values | | | Criteria | | | CQA Monitor |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | N | E | | Dry Density (pcf) | Moisture Content (%) | Proctor Curve No. | Maximum Dry Density (pcf) | Optimum Moisture Content (%) | Insitu Percent Compaction | Difference from O.M.C. | Pass/ Fail (2) | |
| CL-355 | 11/09/11 | 5275 | 2565 | 4 | 104.1 | 20.4 | QCL-2-7 | 104.4 | 17.8 | 100 | 2.6 | PASS | MPD |
| CL-356 | 11/09/11 | 5210 | 2600 | 4 | 102.6 | 21.9 | QCL-2-7 | 104.4 | 17.8 | 98 | 4.1 | PASS | MPD |

Notes:
1. In situ values determined by nuclear methods: ASTM D-2922 for density and D-3017 for moisture content.
2. "PASS" indicates both a percent compaction exceeding the minimum required compaction (95% Max Dry Density) and a moisture content above the optimum moisture content.
3. Test numbers not applicable due to a total rework of Lift 4.

# DRIVE CYLINDER AND NUCLEAR GAUGE COMPARISON

## DRIVE CYLINDER AND NUCLEAR GAUGE COMPARISON

| DRIVE CYLINDER CORRELATION | | NUCLEAR GUAGE CORRELATION | |
|---|---|---|---|
| Test Number: | CL-001 | Test Number: | CL-001 |
| Wet Density: | 122.4 | Wet Density: | 120.3 |
| Percent Moisture: | 25.4 | Percent Moisture: | 24.3 |

# Calibration Certificate

| | |
|---|---|
| **Customer:** | **Texas Enviromental Plastics** |
| **Device Calibrated:** | *Meezan 500 Tensiometer* |
| **S/N:** | *10191996* |
| **Model #:** | |
| **Load Cell Type:** | *Button Type* |
| **Voltage:** | *120/v/* |
| **Date:** | *8-Feb-11* |
| **Calibration #** | *CAL1215* |

Calibration of the PolyWeld USA Meezan 500 Tensiometer was verified using a calibration load cell indicator on dead weights. **2/8/2011** The readings of the calibration set are recorded as "True Load." The readings of the instrument in question are recorded below as "Display Load."

| *True Load* | Display Load Trial #1 | Display Load Trial #2 | Display Load Trial #3 |

# 1.0 INTRODUCTION

## 1.1 Purpose and Scope

The Oak Grove SES Power Station is located in Robertson County, Texas. The FGD-C Pond is the subject of this Liner Evaluation Report (LER). The location of the Oak Grove SES Power Station is presented on Figure 2. The FGD-C Pond is located on the northern portion of the facility, west of FGD-A and FGD-B Ponds as shown on Figure 3. The total footprint of the FGD-C Pond is approximately 22 acres with a lined footprint of approximately 16 acres.

Golder Associates Inc. (Golder) was retained by Luminant Power (Luminant) to provide third party Construction Quality Assurance (CQA) monitoring and testing services during the construction of the embankment and composite liner for the FGD-C Pond.

This report summarizes the CQA monitoring activities, observations and the results of the tests conducted by Golder during the preparation of the subgrade, placement of the embankment fill, and installation of the composite compacted clay/geomembrane liner. It is Golder's opinion that the FGD-C Pond was constructed in compliance with the project plans, specifications and Quality Control Plans.

## 1.2 Project Team

Golder prepared the construction drawings for the FGD-C Pond. Mine Service Inc. (MSI) of Rockdale, Texas performed the construction of the embankment and clay liner. The installation of the geomembrane liner was performed by Lone Star Lining Company (LSL) of Houston, Texas. The protective cover was placed by Headwaters Resources Inc. of Bremond, Texas. Record surveying services for lines and grades, including clay liner and protective cover thickness verification, were provided by Survey and Mapping, Inc. (SAM) of Austin, Texas.

Golder monitored embankment fill placement, compacted clay placement, geomembrane liner installation activities and protective cover placement. Golder's field personnel consisted of a resident CQA manager who was on-site full time during construction. Mr. Jamie Kendall fulfilled the resident CQA manager duties during the FGD-C Pond earthwork activities. He was assisted by Mr. Mark Day during portions of the project.

Geomembrane installation CQA was provided by Mr. Varenya Kumar, Ms. Alexandra Morales and Mr. Mamoudou Sylla.

Mr. Daniel Williams monitored placement of ash as a final cover material over the geomembrane liner.

Resumes detailing the Golder staff's experience is provided in Appendix A. In addition to the presence of a CQA monitor, the professional of record made regular site visits during the course of the project.

The professional of record for the construction of the FGD-C Pond clay liner was Mr. Charles F. Rickert, PE. Mr. Rickert is a registered professional engineer in the State of Texas (PE 62392). He has over 30 years of civil engineering and extensive earthwork construction experience, having been directly involved with numerous CQA earthwork projects. The professional of record for the construction of the geomembrane liner and protective cover was Mr. William E. Gordon, PE. Mr. Gordon is a registered professional engineer in the State of Texas (PE 78933). He has over 29 years of civil engineering experience focusing on soils and geosynthetic lining for waste containment facilities. Resumes detailing Mr. Rickert's and Mr. Gordon's experience are presented in Appendix A. The lines of communication between Mr. Rickert, Mr. Gordon and Golder's field personnel were maintained regularly by telephone. Mr. Rickert visited the Oak Grove SES Power Station site frequently during clay liner construction and was in attendance at progress meetings held on site. Mr. Rickert made visits to the site on June 17, July 21, August 4, August 18, and September 17, 2015. Mr. Gordon visited the Oak Grove SES Power Station frequently during geomembrane and protective cover construction. Mr. Gordon was also in attendance at progress meetings held on site. Mr. Gordon made site visits on September 17, 29, October 13, 27, November 10, December 8, 2015 and January 5, February 2, March 1, April 5, May 3, June 7 and July 12, 2016.

Construction of the FGD-C Pond embankment began on July 12, 2015 and was completed on August 20, 2015. The clay liner was placed between August 21 and September 17, 2015 and the geomembrane was placed between September 21 and October 4, 2015. The protective cover was placed between April 5 and June 24, 2016. Prior to construction, CQA monitoring activities included preconstruction sampling and testing, and CQA activities associated with monitoring of the subgrade preparation. MSI personnel typically worked 10 to 12 hours per day, 6 to 7 days per week.

# 2.0 PROJECT DOCUMENTS AND DESCRIPTION

## 2.1 Project Description

FGD-C Pond was constructed above and below grade using fill obtained from on-site borrow sources. The pond embankments have 3H:1V interior and exterior slopes and rise from approximately 5 to 30 feet above the surround ground surface. The composite liner system on the floor and interior slopes consists of the following (from top to bottom):

- 2-foot thick layer of protective cover;
- 60-mil thick textured HDPE geomembrane; and
- 2-foot thick compacted clay.

The composite liner area in plan view is approximately 701,665 square feet or 16 acres. The protective cover consists of a fly ash and bottom ash mixture.

The certification drawing provided by SAM is included as Figure 12. CQA soil testing was performed according to the project plans, specifications and QCP.

## 2.2 Project Specifications and Drawings

Golder monitored the embankment fill, the composite clay and geomembrane liner construction and the protective cover placement for FGD-C Pond at the Oak Grove SES Power Station utilizing construction drawings and quality assurance documents prepared by Golder.

- Specification No.: A2YF00-0-SP-SI-04, Earthwork, Fluor, December 2006
- Soil Liner Quality Control Plan, Oak Grove Steam Electric Station, Roberson County, Texas, Golder Associates Inc. June 2015
- Geomembrane Liner Quality Control Plan, Oak Grove Steam Electric Station, Roberson County, Texas, Golder Associates Inc. June 2015

## 3.0 EARTHWORKS CONSTRUCTION QUALITY ASSURANCE ACTIVITIES

The CQA monitoring and testing performed by Golder for the embankment fill and clay liner construction consisted of the following activities:

- Participation in the preconstruction and progress meetings between Luminant, MSI, and Golder;
- Collection of preconstruction samples of potential material for use as embankment fill and clay liner;
- Observation and documentation of procedures during construction of the embankment fill and clay liner;
- Performance of field moisture/density tests on the embankment fill and clay liner;
- Acquisition of thin wall tube samples and performance of hydraulic conductivity tests on each lift during clay liner construction;
- Determination of Atterberg limits and particle size distribution (sieve analysis) of clay liner material; and
- Review of survey data for grade control and clay liner thickness verification.

A description of each of the above activities with a summary of the observations is presented in the following sections. A photograph log showing various construction activities is included in Appendix N. The actual number of quality assurance tests performed for this project met or exceeded the minimum number required for compliance with the QCP.

### 3.1 Preconstruction and Construction Sampling and Laboratory Testing

Prior to the use of site soils for the construction of the FGD-C Pond embankment and clay liner, samples were obtained from on-site borrow areas. The soil tests were performed in Golder's geotechnical laboratory in Houston, Texas.

Testing included moisture content (ASTM D2216), particle size analyses (ASTM D422) and Atterberg limits (ASTM D4318). Moisture/density relationships (ASTM D698) were developed for use during construction to document that the percent compaction and moisture content achieved in the field met the requirements of the project specifications and QCP. Hydraulic conductivity tests ASTM D5084 - Method F were performed on remolded specimens as required by the QCP. The test results showed the proposed material was suitable for clay liner construction. The laboratory preconstruction test results are provided in Appendix B.

## 3.2 Embankment Fill

Construction of the FGD-C Pond embankment generally progressed in the following manner:

- Embankment fill material was excavated from the on-site clay borrow source using John Deere tractors pulling scrapers. Material was spread in loose lifts of approximately 8-inches thick. Loose lift thickness was monitored by Golder.
- A water wagon was used to moisture condition the soil when it was necessary to add water following placement in the impoundment.
- The embankment fill was compacted using a tamping-foot roller.

The above procedures were followed for each lift of the FGD-C Pond embankment. The final surface of the uppermost lift was smoothed using a steel drum roller after the required density had been achieved. A survey was performed of the prepared embankment fill surface.

### *3.2.1 Field Moisture/Density Tests*

Field moisture/density tests were performed on the embankment fill using a nuclear density gauge (ASTM D6938) to determine whether the project specifications for compaction had been achieved. The minimum number of density tests required for compliance with the project specifications was one test per 5,000 cubic yards of fill material. Approximately 163,000 cubic yards of fill was placed in the embankment construction requiring a minimum of 33 tests. A total of 182 field moisture/density tests were performed on the embankment fill exceeding the minimum requirement.

The degree of compaction achieved in the field was computed on the basis of the dry density of the soil tested in the fill and the appropriate density standard developed in the laboratory for the material. The embankment fill lifts were placed at a minimum of 95 percent of the maximum density and +3 to -3 percent of the optimum moisture content as determined by ASTM D698 standard Proctor. Holes in the subgrade formed by the mandrel used for the nuclear density test were backfilled with bentonite powder. A summary of the embankment fill density test data is included in Appendix C.

## 3.3 Subgrade Preparation

Project specifications for the FGD-C Pond subgrade required that the material be a minimum of 95 percent of the maximum dry density as determined by the standard Proctor moisture/density test (ASTM D 698). The field moisture/density tests were performed using a nuclear density gauge (ASTM D 2922 and ASTM D 3017) to determine whether the project specifications for compaction had been achieved. The minimum number of density tests required for compliance with the SLQCP was 15 via the nuclear gauge method and 2 via the drive cylinder method (ASTM D 1556). A total of 15 field moisture/density tests via the nuclear gauge method and 2 field moisture/density tests via the drive cylinder method were performed on the subgrade.

The degree of compaction achieved in the field was computed on the basis of the dry density of the soil tested in the fill and the appropriate density standard developed in the laboratory for the subgrade material. Holes in the subgrade formed by the mandrel used for the nuclear density test were backfilled with bentonite powder, and holes formed by the drive cylinders were backfilled and compacted with a bentonite/clay mixture. A summary of the subgrade density test data is included in Appendix D.

## 3.4 Clay Liner Construction Procedures

Construction of the FGD-C Pond clay liner generally progressed in the following manner.

- Clay liner material was excavated from the on-site clay borrow source using John Deere tractors pulling scrapers. Material was spread in loose lifts of approximately 8-inches thick. Loose lift thickness was monitored by Golder.
- Soil clods were broken down by the blade and tracks of the bulldozer as the lift was struck to the proper thickness. A water wagon was used to moisture condition the soil when it was necessary to add water following placement in the impoundment.
- The clay was compacted using a tamping-foot roller.
- Prior to placement of subsequent lifts, the soil surface was watered as needed and then roughened by the cleats of the compactor to facilitate good interlift bonding.
- Throughout construction of the clay liner, water was added as necessary to the surface of previous lifts to prevent excessive drying under the elements of weather.

The above procedures were followed for each lift of the FGD-C Pond clay liner. Four complete lifts were placed across the impoundment for the compacted clay liner with each compacted lift being approximately 6-inches thick. The final surface of the uppermost lift was smoothed using a steel drum roller after the required density had been achieved. A final survey was performed of the prepared clay liner surface for the purpose of thickness verification (Figure 13).

### *3.4.1 Field Moisture/Density Tests*

The field moisture/density tests were performed using a nuclear density gauge (ASTM D6938) to determine whether the project specifications for compaction and moisture content had been achieved. Additional field moisture/density checks were performed using a drive cylinder (ASTM D2937) method on the undisturbed shelby tube samples. The drive cylinder tests were periodically performed in conjunction with the nuclear density gauge to verify the results. The degree of compaction achieved in the field was computed on the basis of the dry density of the soil tested in the fill and the appropriate density standard developed in the laboratory for the clay material (ASTM D698). Holes in the clay liner formed by the mandrel used for the nuclear density test were backfilled with bentonite powder, and holes formed by the shelby tubes were backfilled and compacted with a bentonite/clay mixture.

The Soil Liner Quality Control Plan (SLQCP) for the construction of the FGD-C Pond clay liner required that the material be placed between 2 to 6 percent above the optimum moisture content and compacted

to a minimum of 95 percent of the maximum dry density as determined by the standard Proctor moisture/density test (ASTM D698). The minimum number of density tests required for compliance with the QCP was 88 tests per lift via the nuclear gauge method and a total of 5 via the drive cylinder method. A minimum of 98 field moisture/density tests per lift were performed via the nuclear gauge method. A total of 23 moisture/density tests via the drive cylinder method were performed.

A summary of the clay liner density test data is included in Appendix D. The moisture/density reference curves (standard Proctor) are presented in Appendix B. The locations of each clay liner field moisture/density test are presented on Figures 4 through 7 for Lifts 1 through 4, respectively.

The field moisture/density measurements made with the nuclear density gauge and with drive cylinders are summarized in Appendix E.

### 3.4.2 Hydraulic Conductivity Sampling and Testing

To comply with the SLQCP, one hydraulic conductivity test was required for every 40,000 square feet of compacted clay liner, for each 6-inch (compacted) lift. This equates to 18 tests per lift. A minimum of 19 hydraulic conductivity tests were performed on samples collected from each of Lifts 1 through 4. The samples were obtained by pushing a thin-walled shelby tube (ASTM D1587) into the clay liner. The sample was sent to and tested at Golder's Houston, Texas geotechnical laboratory. The coefficient of hydraulic conductivity was determined according to ASTM D5084 -Method F. The holes formed in the clay liner by the thin-walled tubes were backfilled with a bentonite/clay mixture and compacted. The SLQCP for the construction of the FGD-C Pond clay liner required in-place material to have a hydraulic conductivity of no greater than $1.0 \times 10^{-7}$ centimeters per second (cm/sec). All of the samples tested met this requirement.

The laboratory data for the clay liner hydraulic conductivity for the FGD-C Pond are provided in Appendix B.

### 3.4.3 Atterberg Limits/Sieve Analysis Sampling and Testing

To comply with the SLQCP, one Atterberg limits (ASTM D4318) and sieve analysis (ASTM D422) were required for every 50,000 square feet of compacted clay liner, for each 6-inch (compacted) lift. This equates to 15 tests per lift. A minimum of 19 Atterberg limits and sieve analysis were performed on samples collected from each of Lifts 1 through 4. The SLQCP for the clay liner required that the material used exhibit a liquid limit of no less than 30 percent, a plasticity index of no less than 15 percent, and that the soil fraction passing the No. 200 sieve be no less than 30 percent. All of the samples tested met this requirement.

The clay liner Atterberg limits and percentage of fines (soil fraction smaller than 0.074 mm, which corresponds to the No. 200 sieve) laboratory test results are provided in Appendix B.

### 3.4.4 Thickness Verification

Clay liner thickness was verified by means of an engineering survey, performed by SAM, at points located on a 50-foot grid. Additional data was collected at break lines in the grade of the impoundment floor and at other points which would have otherwise fallen between the points on the grid. These points were compared to the bottom of liner points surveyed on the surface of the subgrade prior to clay liner construction. The SAM thickness verification survey drawing for the FGD-C Pond clay liner is presented as Figure 13.

## 4.0 GEOMEMBRANE QUALITY ASSURANCE ACTIVITIES

The quality assurance monitoring and testing performed by Golder Associates Inc. for geomembrane installation consisted of the following activities:

- Participating in the progress meetings prior to and during installation of the geomembrane;
- Reviewing manufacturer's raw materials and geomembrane roll quality control documents;
- Performing quality assurance testing on samples of the geomembrane material;
- Observing the clay liner to verify that the surface was generally free of irregularities, protrusions and loose soil;
- Observing the anchor trench excavation to verify that the surface was free of loose soil;
- Observing and documenting geomembrane panel placement and verifying thickness during panel deployment;
- Observing and documenting trial seam procedures and evaluating test results;
- Observing and documenting field seams and seaming operations;
- Observing and documenting non-destructive seam continuity testing;
- Locating and documenting seam strength destructive test locations;
- Performing destructive tests on geomembrane seams and evaluation of the test results;
- Locating geomembrane panel and seam defects, and observing and documenting repairs;
- Observing and documenting non-destructive continuity testing of repairs;
- Observing backfill placed in the anchor trenches; and
- Observing protective soil cover placement to ensure that no damage was done to the underlying geomembrane.

A description of the CQA activities and a summary of the observations are presented in the following sections.

### 4.1 Geomembrane Material

The geomembrane liner material installed at this site consisted of a nominal 60-mil textured high density polyethylene (HDPE) geomembrane manufactured in approximately 23 foot wide rolls by GSE Environmental (GSE). A total area of approximately 701,665 square feet of this geomembrane was deployed. Golder personnel inventoried all of the geomembrane material, and a complete inventory list is presented in Appendix F. Copies of the geomembrane resin and roll quality control documents from GSE are included in Appendix G. All test values reported by GSE for the geomembrane met the project specifications.

Quality assurance testing of the geomembrane material was performed by Golder to confirm the material met the project requirements. Testing was performed at a frequency of one per each 100,000 square feet

of material. The quality assurance test results are also included in Appendix G. All test values met the project specifications.

## 4.2 Soil Liner Surface

Prior to deployment of the geomembrane, MSI, who had constructed the clay liner, maintained the soil liner surface. The surface of the soil liner was rolled smooth with a steel drum roller and maintained in a moist condition by a water truck to prevent desiccation. Prior to deployment of the geomembrane the surface was examined by Golder and LSL personnel for any objects that could potentially damage the geomembrane, and any such objects found were removed. Subgrade acceptance certificates are presented in Appendix H.

## 4.3 Geomembrane Deployment

Geomembrane panels were deployed using a rubber tired front end loader with a spreader bar to unroll the geomembrane, and the panels were placed into final position by use of man power. Panels were aligned with a minimum 6-inch overlap. Free edges of the geomembrane were temporarily secured with sand bags.

Each geomembrane panel was marked with a field identification number by Golder CQA personnel. These numbers indicate the order of panel deployment and can be correlated to the manufacturer's roll number using the panel deployment summary in Appendix I. A plan view of the geomembrane panel layout is shown on Figures 8 and 9.

Each panel was visually examined for manufacturing defects and installation damage. Defects were marked, recorded and subsequently repaired.

## 4.4 Geomembrane Trial Seams

The seaming methods used on this project were the dual track fusion welding process and the extrusion welding process. Geomembrane trial seams were made by LSL technicians to test the seaming apparatus (welding machines) and operator's performance under daily site conditions. Trial seams were made each day prior to the start of field seaming in the morning and following the mid-day break.

Specimens from each trial seam were quantitatively and qualitatively field tested by LSL: 3 for peel adhesion (peel) and 3 for bonded seam strength (shear), using a portable field tensile testing machine. The separation mode for each test specimen was classified and documented according to the codes shown on Figures 10 and 11, for dual track fusion and extrusion welds respectively. A summary of the trial seam test results is presented in Appendix J. In the event of a failing test, a second trial seam was made and tested prior to implementation of the welding machine. If the second trial seam failed, two consecutive passing trial seams were required prior to the start of field production seaming.

Golder personnel observed trial seaming procedures and the testing of all specimens from the trial seams.

## 4.5 Geomembrane Seaming

The principal seaming method used on this project was the dual track fusion welding process. The extrusion welding process was used for making repairs, and capping inadequate fusion welds.

Golder personnel observed seaming operations on a routine basis. The observations consisted of checking for proper sheet overlap and periodically checking the seam area to verify that the surface was prepared properly and that the surface area was kept free of moisture, dust, dirt, and debris. All seams were examined for visual quality and seam completion. Visually detected imperfections were marked and subsequently repaired. A summary of the geomembrane seaming data collected by Golder CQA personnel is presented in Appendix K.

## 4.6 Seam Strength Destructive Testing

Geomembrane seam strength destructive test samples were taken at a frequency of at least one per 500 lineal feet of seam. Test locations were selected by Golder CQA personnel based on the progress of each welding machine and observations of the welding operations. After the sample was obtained in the field, one of the three segments of the sample was tested by LSL in the field. If the preliminary field test met the project requirements, one of the remaining samples was sent to. Golder Associates' laboratory in Atlanta, GA for testing. If the preliminary field tests failed to meet the project requirements, additional locations were identified for destructive test samples as part of the procedure for tracking a below specification seam. The remaining segment of each destructive sample was retained on site as an archive. For each of the destructive samples, 10 specimens were removed for testing. Five specimens were tested for peel adhesion (peel) and 5 specimens were tested for bonded seam strength (shear).

The acceptance criteria for both bonded shear strength and peel adhesion were that 4 out of the 5 specimens tested under each condition had to meet the minimum specified strength value and that the average strength values of each set of 5 specimens must meet the specifications. The 5$^{th}$ specimen tested must meet at least 80% of the specified strength. The strength criterion for an acceptable shear test was that the specimen had to exhibit a strength greater than 120 pounds per inch. Additionally, the specimen had to exhibit an acceptable break code as defined by the Geosynthetic Institute guidance document GRI-GM19 for seam strength and related properties of thermally bonded Polyolefin Geomembranes. The criterion for an acceptable peel test was that the specimen had to exhibit a strength greater than 78 pounds per inch for an extrusion weld and a strength greater than 91 pounds per inch for a fusion weld, and also exhibit an acceptable break code. Both tracks of dual track fusion welded seams were tested in peel. Separation modes for the test specimens were reported according to the modes shown on Figures 11 and 12.

The total length of fusion welded seams (not including repairs) was approximately 25,017 feet, which corresponds to a minimum number of destructive seam strength tests of 51 at a frequency of one per 500 linear feet of seam. Initially Golder monitors located 85 areas for destructive seam strength testing. A total of 1,058 feet of extrusion welding was performed in the repairs of defects (greater than 10 feet in length) requiring an additional 3 destructive tests of extrusion welds at a frequency of one per 500 feet. A total of 3 extrusion weld destructives were tested.

In the case of a passing destructive test, a patch was welded over the area from which the sample was taken. In the case of a failing test, additional samples were to be taken from seams or repairs completed by the same seamer and/or seaming apparatus which were seamed before and after the failed area. This process is repeated until failing area is bound on both sides with seams meeting the project requirements. There were no failing destructive seams tests during geomembrane installation in FGD-C. All destructive seam strength samples were tested by Golder Associates in Golder's Atlanta, Georgia laboratory. A summary of the destructive test results for geomembrane seam samples is included in Appendix L, and the locations are shown on Figure 8. Non-Destructive Seam Continuity Testing

Geomembrane seams and seam repairs were tested for continuity by LSL. The air pressure method was used for dual track fusion welds, and the vacuum box method was used for extrusion welds.

Golder CQA personnel observed and documented non-destructive testing of seams and seam repairs on a full-time basis. A summary of non-destructive testing of seams is included in the geomembrane seam summary presented in Appendix K. All tested seam lengths and repairs passed the project non-destructive testing requirements.

## 4.7 Geomembrane Defects and Repairs

Each geomembrane panel and seam was visually observed for defects. The term "defect" refers to manufacturing blemishes, installation damage including burns and creases, incomplete seaming, wrinkles and fish mouths. Defect identification codes were also assigned to multiple panel intersection points, as the project documents required patches at these locations. These observations were made on an on-going basis throughout the installation process.

Defects were logged by Golder Associates' personnel, who also observed repair operations performed by LSL. These observations were made to verify that all noted defects were repaired and documented. A summary of defects and repairs is contained in Appendix M, and the locations of repairs are shown on Figure 9.

LSL welded patches at destructive seam strength sample locations, at holes created during installation, in areas of insufficient overlap for seaming, and at intersecting fusion-welded seams ("T's"). Spot welds

were made by the installer to small isolated manufacturing blemishes, creases and minor scratches on the geomembrane panels. Minor defects in extruded seams were repaired by lightly grinding and rewelding these areas.

## 4.8 Non-Destructive Testing of Repairs

LSL non-destructively tested geomembrane defects, patches and panel repairs for continuity. The vacuum box method was used for all such testing.

Golder Associates' CQA personnel observed and documented non-destructive testing of defects and repairs on a full time basis. A summary of non-destructive testing of defects and repairs is presented in the Repair Summary in Appendix M.

## 5.0 ANCHOR TRENCHES

The geosynthetics were anchored in a trench above the slopes. The anchor trench was approximately 2 feet wide by 2 feet deep. The anchor trench detail is shown on Figure 10. The soil removed from the anchor trench was used as backfill. Soil was placed in loose lifts and compacted using the rubber tires of a backhoe. Care was taken to verify that no damage was inflicted to the geosynthetics in the anchor trenches as a result of the backfilling operations, which was verified by Golder personnel.

## 6.0 PROTECTIVE SOIL COVER

A protective cover, consisting of a minimum two feet of fly-ash/bottom ash mixture, was placed over the geomembrane. Placement of the protective cover and construction were observed by Golder Associates' personnel to verify that the geosynthetics were not damaged by construction equipment. The SAM thickness verification survey drawing for the FGD-C Pond protective cover is presented as Figure 13.

## 7.0 SUMMARY

Golder Associates Inc. (Golder) was retained by Luminant to provide third party Construction Quality Assurance (CQA) monitoring and testing services during the construction of the composite liner for the FGD-C Pond at the Oak Grove SES Power Plant. The CQA monitoring and testing services consisted of the following activities:

- Participating in and documenting the preconstruction and weekly construction progress meetings;
- Preconstruction sampling and testing of clay materials;
- Monitoring and documenting clay liner subgrade preparation;
- Monitoring and documenting clay liner construction procedures;
- Performing field moisture/density tests (including dive cylinder tests) on the prepared subgrade;
- Performing field moisture/density tests (including drive cylinder tests) on the compacted clay liner;
- Collecting and testing clay liner samples for hydraulic conductivity for the compacted clay liner;
- Collecting and testing sets of Atterberg limits and sieve analyses for the compacted clay liner;
- Reviewing survey data for thickness verification;
- Reviewing quality control submittals for the geomembrane liner materials. Performing quality assurance testing of the geomembrane liner material;
- Monitoring and documenting soil liner surface preparation;
- Monitoring and documenting geomembrane deployment;
- Monitoring and documenting trial and field seaming;
- Monitoring and documenting non-destructive seam continuity testing;
- Monitoring and documenting geomembrane repair procedures; and
- Monitoring and documenting installation of the protective cover.

Based on the observations and testing performed by Golder during the monitoring of the FGD-C Pond subgrade preparation and clay liner construction, it is in Golder's opinion that the liner was constructed in compliance with the project plans, specifications and Contractors Quality Assurance/Quality Control Plan (QCP).

Sincerely,
**GOLDER ASSOCIATES INC.**

# APPENDIX A
# RESUMES OF GOLDER PROJECT PERSONNEL

# Golder Associates Inc. – Houston

## Employment History

***Golder Associates Inc. – Houston, Texas***
*Senior Engineer (1997 to Present)*

Project manager and certifying engineer for multi-disciplined civil engineering projects, including preparing contract documents and engineering reports, managing projects, conducting permitting studies, preparing construction plans, and providing construction management. Project management responsibilities included coordinating bidding activities, overseeing contractors, tracking project costs and performance, and supervising field staff performing construction and/or CQA activities.

Projects include:

- Preparing municipal solid waste landfill design plans and specifications
- Administrating contracts for municipal solid waste collection and transportation
- Providing plans and recommendations for improving operational efficiency in waste collection and transportation
- Conducting economic modeling of site operations and profitability
- Providing municipal solid waste landfill construction quality assurance
- Providing municipal solid waste landfill closure designs, cost estimating, and construction quality assurance
- Preparing industrial solid waste landfill design plans and specifications
- Providing industrial waste landfill construction quality assurance
- Preparing municipal solid waste landfill permit applications, amendments, and modifications
- Conducting environmental site assessments and compliance audits

***Harding Lawson Associates – Houston, Texas***
*Senior Engineer (1987 to 1997)*

Certifying engineer and project manager for geotechnical, environmental, and construction quality assurance for solid and hazardous waste and civil engineering projects in Texas. Numerous projects involved municipal solid waste landfill composite liner system construction quality assurance. Projects also included preparing municipal solid waste landfill permit amendments or modifications and preparing construction plans and specifications, environmental due-diligence, and monitor well installation.

Projects included:
– Prepared municipal solid waste landfill design plans and specifications
– Conducted municipal solid waste landfill construction quality assurance
– Prepared municipal solid waste landfill permit applications, amendments, and modifications
– Provided RCRA Superfund site remediation management
– Prepared hazardous waste landfill design plans and specifications
– Provided hazardous waste landfill construction quality assurance
– Conducted hydrogeologic investigations

## Education

*BS Mining Engineering, Texas A&M University, College Station, Texas, 1984*

*Continuing Education & Short Courses:*

*CSTS, Fort McMurray, Alberta, CA., 2011*

*OSSA, Fort McMurray, Alberta, CA., 2011*

*Workplace Hazardous Material Information System, Fort McMurray, Alberta CA., 2011*

*H2S Alive, Fort McMurray, Alberta Ca., 2011*

*MSHA Mine Safety Certificate, Surface Metal and Nonmetal , Denver Co, 2011*

*Geosynthetic Clay Liner University, 2008*

*Landfill Gas Systems Operations and Maintenance, 2004*

*Designing with Tensar Geogrids, 2004*

*Geosynthetics for Advanced Solutions, 1999*

*Landfill Gas System Engineering Design, Landtec Inc., 1994*

*Geosynthetics Installation CQA/CQC, National Seal Corp., 1993*

*Landfill Liner System Design and Construction, University of Florida, 1991*

*Hydrology and Sedimentology, New Mexico Department of Mining and Mineral Resources, 1986*

*Xerox – Critical Skills for Supervision, 1986*

*Clay Liners and Covers for Waste Disposal Facilities, University of Texas, 1989*

## Certifications

- Performed municipal solid waste groundwater monitoring and reporting
- Provided design plans and specifications for sludge drying basins
- Completed environmental site assessments and compliance audits

***Santa Fe Pacific Coal Corporation – Grants, New Mexico***
*Engineer (1985 to 1987)*

Mine engineer responsible for environmental compliance of a surface mining facility. Responsibilities included providing surface water control, construction designs and monitoring; providing reclamation plans, specifications, and supervision; placing segregated mine spoil into a 15 million cubic yard stockpile; completing annual environmental report production; and coordinating archaeological and biological surveys, as well as various drilling, blasting, and surveying projects. Served on drilling and blasting crew, coal seam boring crew, and was also an 85 ton coal haul driver.

## PROJECT EXPERIENCE – MUNICIPAL AND INDUSTRIAL WASTE LANDFILLS

| | |
|---|---|
| **Suncor**<br>Fort McMurray, Alberta, Canada | Construction site manager for the final closure construction of two monofills and the construction of a new landfill, roads and surface water management structures. Managed a crew of up to 40 people performing the construction. Provided bi-weekly reporting to Suncor management on site progress, safety and scheduling. |
| **Waste Collections and Transportation**<br>Abu Dhabi, United Arab Emirates | Provided waste collection and transportation contract administration for the Abu Dhabi Emirate, UAE. Provided contract management, evaluated requests for variances, provided recommendations for improving operations, reported to the Municipality regarding all phases of contractor activities and provided recommendations for contract revisions to improve services. Assisted in implementing electronic data management system to track contractor performance. Assisted contractors in revising manpower and equipment resources and allocation to improve services and response to requests from the public. |
| **Construction Management at Municipal and Industrial Solid Waste Landfills**<br>Various Locations, Texas | Provided construction management services during the construction of numerous municipal solid waste landfill cells and site expansions. Prepared bid packages and evaluated contractor bids, provided oversight of construction progress and costs, and reviewed contractor invoicing, including reviewing and approving contractor change orders and progress billings. |
| **Construction Quality Assurance of Municipal Waste and Industrial Waste Landfills**<br>Oregon, Texas, and Mexico | Certifying engineer and project manager for construction quality assurance activities during the installation of both clay and geosynthetic components of composite liner systems at numerous landfills in Texas, Oregon, and Mexico. Typical work includes preparing or reviewing construction plans and specifications, conducting preconstruction sampling and testing of both soils and geosynthetic components, reviewing manufacturers' quality control documentation for geosynthetic products, directing field monitoring staff during construction activities, providing technical guidance to construction contractors, and preparing certification documents for site owners to submit to regulatory agencies. |
| **Municipal Solid Waste Landfill Permit Application Preparation**<br>Fort Worth and Houston, Texas | Project manager for preparing major amendments for two municipal solid waste landfills in Texas. Managed all aspects of the applications, including location restrictions, hydrogeologic investigations, geotechnical investigations, preliminary designs, operating plans, soils and liner quality control plans, closure and post closure plans, leachate and contaminated water plans, and groundwater monitoring plans. Participated in regulatory agency technical negotiations and public hearings. |

**Municipal Solid Waste Landfill Operations**
Hawaii and Texas

Assist site operations personnel in site management and regulatory compliance of active landfill sites. Assist in planning construction activities, managing stormwater, and controlling traffic. Prepared responses to notices of violations received by site managers relating to operations or environmental issues. Prepared permit modifications to update existing facilities to current standards.

Prepared the operations manual for the remaining active life and closure of a municipal solid waste landfill constructed in volcanic rock in Hawaii. Plans included the Surface Water Management Plan, Interim Groundwater Monitoring Plan, Hazardous Waste Exclusion Plan, Asbestos Management Plan, and the Landfill Gas Migration Monitoring Plan. The site was located in volcanic rock containing lava tubes, which allowed local tidal variations to affect the groundwater elevations daily.

Site engineer for the daily operations of a municipal solid waste landfill in Texas. Typical duties included consulting on disposal plans and traffic management, determining construction sequencing for liner systems, conducting groundwater monitoring, and coordinating regulatory agency inspections of landfill operations and responses. Managed the construction quality assurance for clay soil liners in landfill cells. Prepared construction reports for submittal to state regulatory agencies.

**Municipal Solid Waste Landfill Acquisitions**
Arkansas, Mississippi, Tennessee, and Texas

Worked with site owners to evaluate construction and operating costs for both existing landfill sites and potential acquisitions. Evaluated construction costs, airspace utilization, compliance monitoring, operating, and closure and post closure costs for the anticipated site life of each facility.

Conducted site investigations, compliance history audits, and personnel interviews at several existing solid waste management facilities being evaluated as potential acquisitions by clients in Texas, Tennessee, and Arkansas. Prepared Environmental Due Diligence reports of the findings of these audits.

## PROJECT EXPERIENCE – RCRA HAZARDOUS WASTE SITE REMEDIATION

**Site Remediation**
Great Falls, Montana

Site manager for the remediation of two sites in Great Falls, Montana with a total of over seven hundred drums of RCRA classified hazardous waste from the early 1940's. Responsibilities included managing a crew of four technicians during the remediation process. Activities included the opening and characterization of each intact drum, with work conducted in "Level C" personal protective equipment including full face respirators, in sub-zero weather. Arranged for the disposal of the drums and approximately ten feet of affected soils from beneath the drum areas, and managed the transportation of the drums and affected soil to an approved disposal location. The sites were successfully cleaned and the work accepted by the regulatory agencies.

**Remedial Design**
Weslaco, Texas

Assistant project manager for preparing construction drawings and specifications for the remediation of The Munoz Borrow Pits State Superfund site in Texas. The project involved removing affected soils from approximately 2 acres of private land. Design included detailed excavation and sampling plans to guide the remediation effort as well as site drainage and reconstruction. Prepared the Sampling and Analysis Plan and the Quality Assurance Project Plan for the project.

**Remedial Construction**
San Antonio, Texas

Site engineer for the remediation of PCB-containing soils located beneath an underground transformer vault in San Antonio, Texas. The project involved installing an injected grout curtain into the subsurface gravel around the affected site to restrict the inflow of groundwater into the excavation. Subsequent to the installation of the grout curtain, the site was excavated and sampled until the analyses indicated PCBs below action levels.

## PROJECT EXPERIENCE – SITE ASSESSMENTS AND SURVEYS

**Environmental Site Assessments**
Arkansas, California, Louisiana, Tennessee, and Texas

Performed Phase I Environmental Site Assessments at several multi-family residential units in California.

Performed Phase I Environmental Site assessments at two industrial sites in Texas and Louisiana.

Performed a Phase I Environmental Site Assessment of a multi-story (40+ floors) office building in Houston, Texas.

Performed Environmental Due Diligence assessments at solid waste management sites in Arkansas and in Tennessee.

**Electrical Resistivity Surveys**
Alvin, Texas

Performed two electrical resistivity surveys at a municipal solid waste landfill in Texas. The surveys included both sounding and profiling data collected from 140 stations spaced 100 feet apart around the perimeter of an existing landfill. The purpose of the study was to investigate the possibility of leachate migration from the landfill. The data was compared to that from previous field surveys to identify indicators of possible leachate migration from the landfill. Prepared reports for each survey, which was submitted to and accepted by the state regulatory agencies.

## PROJECT EXPERIENCE – MINING

**Chevron Mining Inc**
New Mexico, USA

Onsite construction management of remediation activities at the McKinley County surface coal mine. Responsible for oversight of contracted crews performing major earthworks construction and assuring work conformed with the facility permit, applicable regualtions and project designs. Earthworks included segregated fill and grading operations moving in excess of 20,000 cubic yards daily, topsoil placement and seeding and drainage channel construction covering over approximatley 20 miles.

**Site Environmental Compliance**
Grants, New Mexico

Site engineer responsible for conducting the environmental monitoring and reporting all aspects of the operation of a surface coal mine in Grants, New Mexico. Prepared soil management and reclamation plans to manage excess overburden material. Performed soil sampling and classification in advance of the mining. Conducted NPDES monitoring of stormwater at outfalls around the facility. Conducted groundwater monitoring at wells around the site. Coordinated wildlife and endangered species investigations in advance of the mining operations. Oversaw cultural resources site investigations. Prepared annual reports to the regulatory agencies detailing the yearly operations and environmental activities.

**Site Operations**
Grants, New Mexico

Actively participated in numerous activities related to operating the coal mine. Conducted surveys for site layout and blasting patterns. Conducted coring operations of coal seams in advance of the mining operations and prepared reserve estimates. Performed soils testing of samples of overburden material to prepare the overburden management plan for the facility. Worked as a laborer on blasting and 85 ton coal hauling crews.

## TRAINING

***CSTS***
*Fort McMurray, Alberta, CA, 2011*

***OSSA***
*Fort McMurray, Alberta, CA, 2011*

***Workplace Hazardous Material Information System***
*Fort McMurray, Alberta, CA, 2011*

***H2S Alive***
*Fort McMurray, Alberta, CA, 2011*

***MSHA Mine Safety Certificate***
*Surface Metal and Nonmetal, Denver, CO, 2011*

## PROFESSIONAL AFFILIATIONS

American Society of Civil Engineers

## Education

*Bachelor of Science Civil Engineering, Texas A&M University, Texas, 1980*

*Continuing Engineering Studies Landfill Leachate and Gas Management Design, University of Florida, 1992*

*Continuing Education Technical and Business Writing, Murray Associates, 1989*

*Continuing Engineering Studies Clay Liners and Covers for Waste Disposal Facilities, University of Texas, Texas, 1989*

## Certifications

*Professional Engineer, Arkansas #9447*

*Professional Engineer, Mississippi #14154*

*Professional Engineer, Louisiana #27506*

*Professional Engineer, Oklahoma #18401*

*Professional Engineer, Texas #62392*

## Languages

*English – Fluent*

# Employment History

***Golder Associates Inc. – Houston, Texas***
*Associate (1995 to Present)*

Responsibilities include engineering and managing environmental, geotechnical, and construction quality assurance (CQA) projects. Projects have involved design and CQA for coal power plant ash landfills and surface impoundments, and municipal solid and hazardous waste landfill construction including the design and CQA services for containment cells and landfill gas systems.

***Harding Lawson Associates – Houston, Texas***
*Senior Engineer (1986 to 1995)*

Responsibilities included engineering and managing various environmental, geotechnical, and construction quality assurance projects. Projects included:

- Municipal solid waste landfill construction quality assurance
- Hazardous waste landfill construction quality assurance
- Hazardous landfill site feasibility study
- Hydrogeologic investigations
- Geotechnical investigation and shallow foundation design
- Hazardous facility/unit closures
- Environmental site assessment and compliance audits
- Environmental site investigation and remediation
- Underground storage tank investigations and closures

***Fugro Inter, Inc. – Houston, Texas***
*Project Engineer (1980 to 1986)*

Responsibilities included engineering and managing offshore geotechnical projects. Projects included:

- Geotechnical investigation and foundation design for offshore platforms
- Jack-up rig foundation investigations

## PROJECT EXPERIENCE – POWER

Project Manager for a viewshed analysis for the potential vertical expansion of the Luminant Oak Grove SES Ash Landfill including providing the client with a viewshed map showing the Zone of Theoretical Visibility (ZTV). Photomontages were created showing the project expansion from selected viewpoints. The photomontages rendered views of the proposed expansion and were modeled based on the proposed design and project components. The landfill was superimposed over the photos collected in the field and faded back to show the features blocking the view towards the project (e.g. trees).

Project Manager providing engineering services related to the continuing development of the Luminant Oak Grove SES Ash Landfill. The scope of work included preparation of construction drawings and related documents to support construction of a 30 acre ash landfill cell.

Project manager and engineer of record providing construction quality assurance (CQA) during the construction of a 50 acre ash landfill cell, FGD Pond and Lignite Run-off Pond at the Luminant Oak Grove SES.

Project manager during a screening-level siting evaluation of three potential new flue gas desulfurization (FGD) effluent pond locations at the Luminant Oak Grove SES, including evaluation of constructed liner options and order-of-magnitude costs. The objective was to provide a subjective ranking of each site's suitability, focusing on location restrictions, along with providing budgetary estimates for differing liner designs and overall construction costs.

## PROJECT EXPERIENCE – MUNICIPAL AND HAZARDOUS WASTE LANDFILLS

**Landfill Gas Systems**

Prepared construction drawings and contractor bid documents for landfill gas systems. Directed construction quality assurance of construction services during landfill gas system installation.

**Design and Construction Quality Assurance of Municipal Waste Landfills**

Prepared construction drawings and contractor bid documents for containment cell constructions. Directed construction quality assurance during construction of compacted clay liners. Work has included sampling and testing preconstruction soil, reviewing construction specifications, directing field monitoring staff, providing technical guidance to construction contractors, and preparing certification documents for the owners and state agencies. Work has also included direct monitoring during the installation of geosynthetic liners.

**Hazardous Waste Landfill Site Feasibility Study**

Conducted a study in conjunction with a Material and Area Feasibility Study to evaluate site-specific requirements for the construction of a hazardous waste landfill to meet applicable federal, state, and local regulatory requirements. The study included:

evaluating waste types, volumes, and generation rates
evaluating regulatory criteria
determining specific site considerations and limitations
providing conceptual design alternatives
evaluating and screening of alternatives
designing facility layout
evaluating material quantities and availability
determining construction cost estimates and schedules
evaluating operation and maintenance requirements

**Construction Quality Assurance of Hazardous Waste Landfills**

Directed construction quality control during the construction of a hazardous waste landfill cell. Work included reviewing construction specifications, fulfilling daily project management duties, directing field technicians, reviewing field documentation, and communicating with landfill personnel.

**Construction and Testing of Soil Test Pads**

Directed the construction and subsequent testing of clay and betonite amended soil test pads. The purpose of the test pads was to establish construction procedures for landfill liner systems and to demonstrate that the pad, constructed under specific controlled repeatable conditions, could achieve a specified hydraulic conductivity. Testing procedures for determining hydraulic conductivity included sealed double-ring infiltrometers, Boutwell permeameters, and laboratory permeability tests on selected samples.

## PROJECT EXPERIENCE – REPRESENTATIVE PROJECTS

**Site Assessments**

Project Manager on over 20 environmental site investigations for underground storage tanks. Project included drilling and sampling soil borings, installing groundwater monitor wells, conducting site hydrogeologic characterizations, analyzing soil and groundwater, and providing recommendations for site remediation.

Project Engineer on a project for site characterization of an abandoned hazardous waste disposal site located in Niagara Falls, New York. Under strict health and safety protocol, conducted site exploration, which included completing a buried metals survey, drilling and sampling, and installing groundwater monitoring wells.

Project Engineer for environmental site investigation. Duties included drilling and sampling soil borings, installing groundwater monitoring wells, assessing soil and groundwater contamination, developing closure plan, and implementing clean-up of an abandoned pit containing paint manufacturing waste and solvents. Clean closure involved excavating and disposing of approximately 3,500 cubic yards of Class I and Class II waste.

Senior Engineer responsible for collecting and classifying soil samples on inactive artillery/firing ranges at Fort Ord Army Base. Analyzed soils for explosives and metals. The work was performed under strict health and safety protocol due to live ornaments and biohazards.

Project Manager responsible for assessing and cleaning of a chemical spill beneath a hospital building. The spill material was an x-ray film development solution.

Senior Engineer providing oversight and recommendations for the cleanup of a marsh adjacent to a Superfund site.

**Facility/Unit Closures**

Project Manager responsible for constructing of a clay test pad to establish the construction procedure for a clay cover and liner system. The test pad demonstrated that a cover and liner constructed under specific controllable and repeatable conditions could attain a hydraulic conductivity of 1 x 10-7 cm/sec or less, as determined by in-situ sealed double-ring infiltrometer (SDRI) testing performed as a part of this project. Four SDRI's were installed on the test pad. Prepared a report for the client to present to the Texas Water Commission.

Project Manager responsible for providing Construction Quality Control (CDC) during construction of a clay cover for a RCRA closure of two hazardous waste surface impoundments. Project duties included monitoring the construction operations, providing quality control to comply with project specifications, and communicating with the facility personnel and contractors.

Project Manager responsible for providing CQC during construction of a clay liner for a storm water pond facility. Project duties included monitoring the construction operations, providing quality control to comply with project specifications, and communicating with the facility personnel and contractors.

Senior Engineer responsible for the RCRA closure of a hazardous waste incinerator and feed tank. Project duties included supervising the field crew, monitoring the decontamination operations, collecting verification samples, and preparing and submitting the certification report to the Texas Water Commission.

Developed a closure and contingency plan for 16 hazardous waste treatment/storage units at an industrial wastewater treatment facility.

**Underground Storage Tanks**

Project Engineer for closure of a leaking underground storage tank (UST) discovered during construction of Metro's Northwest Transit Center project in Houston, Texas. Project included performing electromagnetometer and ground penetrating radar surveys to clear work areas of other USTs.

**Preliminary Site Assessments**

Performed an Environmental Hazardous Materials Site Assessment to identify potential environmental concerns at three truck stop sites. The assessment included reviewing the site history and available data, conducting a regulatory agency review, completing a site visit, and performing off-site reconnaissance.

Performed an environmental site assessment (ESA) to identify potential environmental concerns for properties prior to real estate transactions. The ESA included reviewing the site history and available data, conducting regulatory agency review, completing a site visit, and performing off-site reconnaissance.

**Landfill Construction**

Project Engineer responsible for providing CQC during the construction of two soil/bentonite test liners to establish the construction procedures for a landfill liner system. Provided significant guidance to the contractor who was inexperienced in constructing liners with soils available at the site. The purpose of the test liners was to demonstrate that the designed soil/bentonite liner, constructed under specific controlled repeatable conditions, could attain a hydraulic conductivity of 1 x 10-6 cm/sec or less. Intalled and monitored two in-situ sealed double-ring infiltrometer (SDRI) units on each test liner to determine the hydraulic conductivity.

Project Manager providing Construction Quality Assurance (CQA) services during construction of a cell at a hazardous waste landfill in Oklahoma. Duties included reviewing construction specifications, fulfilling daily project management duties, providing guidance for the field technicians, reviewing field reports and test results, and communicating with landfill personnel.

Project Manager responsible for overseeing construction of a clay liner for cell expansions at Type I and Type IV landfills. Project duties included monitoring the construction operations, providing quality control to comply with regulatory specifications, and submitting a soil liner evaluation report (SLER) to the state.

Project Manager responsible for providing CQC services during the initial construction of a landfill facility. The project included overseeing and monitoring site grading, constructing detention basins and drainage ditches, and observing and testing concrete poured for spillways, flow channels, and junction boxes.

Senior Engineer responsible for overseeing drilling and sampling pilot soil borings and designing and installing monitor wells for a new landfill facility.

**Construction Monitoring**

Project Engineering responsible for construction surveillance of new fluid milk plant in Austin, Texas. Project involved testing soil and concrete, preparing subgrade, and placing concrete for pavements and foundations. Duties included supervising field test fill, fulfilling daily project management duties, reviewing field reports and test results, and preparing periodic summary reports.

Performed construction surveillance for a jet engine test facility at Ellington Air Force Base, Texas. Project included conducting an on-site inspection of foundation construction and preparing subgrade.

Managed soil and concrete testing for a new church in Houston, Texas. Responsibilities included reviewing field technician's daily reports and test results.

**Geotechnical**

Project Manager responsible for conducting a geotechnical investigation to assess the stability of a containment dike surrounding an above-ground surface impoundment. Duties included supervising the drilling and sampling operations, assigning a laboratory testing program to determine the engineering characteristics of the soils, and preparing a report summarizing the field activities and laboratory testing.

Senior Engineer responsible for preparing a geotechnical and geological assessment for a proposed asbestos pit. Duties included supervising the soils investigation, assigning laboratory testing to evaluate the engineering characteristics of the subsurface soils, and preparing a report providing slope stability analyses and construction recommendations.

Managed field exploration to determine subsurface characteristics and to provide engineering design and construction recommendations for an extraneous water treatment plant for an expansion of a bromine facility in Magnolia, Arkansas.

Managed field exploration for geotechnical investigations at several gasoline service stations. Provided recommendations for foundation support of the service station facilities.

Performed geotechnical investigations for onshore exploratory drilling rigs. Used cone penetration testing (CPT), interpreted CPT data, and calculated axial capacities for pile foundations.

Participated in dynamic compaction investigation for levee design using cone penetration testing (CPT). Responsible for aquiring soils data and reporting.

Supervised more than 65 onshore and offshore projects including mobilization of equipment, site investigation and demobilization. Duties included classifying soil samples, performing field tests, and preparing field reports.

Performed engineering analyses and developed recommendations for foundation design on over 40 offshore projects. Analyses included axial pile capacity, lateral soil resistance, load transfer, mudline bearing capacity, and pile driveability.

Performed over 40 jack-up rig foundation investigations. Supervised drilling and soil sampling operations. Analyses included estimating leg penetrations after preloading, and assessing rig stability with respect to punch-through failure.

**Permitting**

Senior Engineer responsible for preparing the Engineering Report, Section III of the Texas Water Commission Permit Application for Hazardous Waste Storage/Processing/Disposal Facility (Part B instructions) for two hazardous waste impoundments.

# Golder Associates Inc. – Houston

***Geotechnical Engineer***

Varenya Kumar is a geotechnical engineer with over four years of experience in the consulting industry. His areas of interests include slope stability, deep foundations, earthquake engineering, mine-ore stockpiles, MSE Walls, CPTs, and ground improvement. At Golder, he has worked on projects serving the oil and gas, mining, waste management and urban infrastructure industries. The projects involved geotechnical exploration, geotechnical/earthquake engineering analyses and field assignments, focusing on foundations for onshore and offshore LNG terminals, stability of dams and landfills, probabilistic seismic hazard analysis, risk assessment, stability and drainage of leaching stockpiles, and mine tailings management. He has worked on research projects associated with MSE walls, compaction control and geotechnical change orders in construction.

# Employment History

***Golder Associates – Houston, Texas (Previously in Irvine, CA)***

*Geotechnical Engineer (2012 to Present)*

Involved in engineering analyses for projects serving the mining, oil and gas, waste management and urban infrastructure industries. Carried out geotechnical exploration, seismic hazard analysis, risk assessment, slope stability (for cut slopes, levees, stockpiles), tailings management, and foundation design. Field assignments include subsurface exploration - CPTu investigations and drilling in soils and rock - for assessing stability of mining pits and heap leach pads.

***Purdue University – West Lafayette***

*Teaching Assistant (2010 to 2010)*

Worked as a teaching assistant for geotechnical engineering course, CE-383. Was awarded the Nellie Munson Teaching Award and the Committee for Education of Teaching Assistants (CETA) Award for the year 2010.

***Purdue University – West Lafayette***

*Research Assistant (2009 to 2011)*

Handled research projects in geotechnical engineering that included field and laboratory testing, and engineering analyses. The different areas of work included assessing geotechnical properties of a backfill mixture for MSE walls, use of dynamic cone penetrometer testing for compaction control and analysing geotechnical change order data from pavement construction projects for the Indiana Department of Transportation.

## PROJECT EXPERIENCE – GEOTECHNICAL ENGINEERING

| | |
|---|---|
| **LNG Processing, Storage and Export Terminal**<br>Nova Scotia, Canada | Performed foundation design for the nearshore jetty and wharf. Characterized the site based on soils investigation, and determined design parameters. Designed pile foundations in rock sockets for resisting axial and very high lateral loads. |
| **Confidential Client**<br>Southwest US, USA | Geotechnical exploration and analysis at two separate mine sites, directed towards assessing the drainage conditions and stability of heap leach pads. Tasks involved on-site supervision of CPTu investigation, horizontal drilling, and piezometer installation for investigating and remediating slope movement. Performed analysis of CPTu data to determine soil properties and pore pressure conditions. Supervised the installation of vertical pumping wells as part of a drainage improvement program on the heap leach pad. Worked with hollow-stem auger, vertical air-hammer and horizontal drill rigs. |
| **Confidential Client**<br>Papua, Indonesia | Geotechnical design of two 50 km long tailings levees. The major tasks involved analysis of CPT, SPT, laboratory tests and surface wave (MASW) data. The data analysis was used to determine the soil properties across 94 sections for use in slope stability/deformation assessment, seepage evaluation, liquefaction analysis and foundation settlement on highly plastic clays. Performed static and seismic slope stability analysis using SLIDE for the levees. |
| **US Army Corps of Engineers**<br>Alaska, USA | Geotechnical analysis of a ring-levee system surrounding an airfield in Galena located in West-Central Alaska. The project was part of an emergency FEMA response to ice-jam floods that occurred in May 2013 in the village of Galena. Work involved analysing geotechnical data and performing levee stability, seepage, piping and liquefaction analysis under permafrost considerations, and providing appropriate repair measures and recommendations. |
| **Oak Grove Steam Electric Station**<br>Texas, USA | Conducted slope stability assessment on three flue gas desulpharization ponds to evaluate the ponds according to latest coal combustion residue regulations. |
| **LNG Processing, Storage and Export Terminal**<br>Cyprus | Involved in the characterization of the brownfield site, with existing fill and abandoned underground structures and foundations, and significant topographic relief. Processed borehole logs, CPT information, field and lab test data to characterize site topography. |
| **Cortez Mines**<br>Southwest US, USA | Geotechnical exploration for designing the mine pit slope and assessing stability of existing pits. Tasks included managing a rotary air-blast drill rig and, soils and rock core logging. |
| **Temple Landfill**<br>TX, USA | Geotechnical exploration and analysis for the permitting of proposed expansion at the Temple Waste Storage and Disposal Facility. Tasks include planning for geotechnical exploration, laboratory test assignment and review, stability and settlement analysis, and leachate collection system design. |
| **Confidential Client - Alvin, TX**<br>TX, USA | Performed design and construction quality control for remediation of a failed landfill slope containing chemical waste. Performed back analysis to identify the the causes of failure, and designed the repair and reconstruction. |

| | |
|---|---|
| **Ridgecrest Landfill**<br>California, USA | Involved in the proposed design of the leachate collection and removal system. Used the HELP model to evaluate leachate drainage layer capacity and calculate leachate drainage rates for design. |
| **Simi Valley Landfill**<br>California, USA | Performed stability analyses for design of a landfill system. Used SLIDE 6.0 to conduct 2-D static and pseudostatic analyses for different landfill configurations. Designed landfill geometry and seismic berms under site constraints, by computing the static and pseudo-static factors of safety and seismic displacement. Performed pile design for a settlement mitigation effort for the weight scales at the landfill. |
| **Elkwater and Bullshead Lakes, Alberta**<br>Alberta, Canada | Evaluated the applicability of past dam safety reviews for two dams based on current data and field observations. Conducted static slope stability analysis for the two dams under relevant loading conditions to assess the dams' compliance with design guidelines. |
| **PAN Mine**<br>Nevada, USA | Performed construction quality control assurance for subgrade, liner and overliner placement for a heap leach pad. |
| **Battle Mountain Mine**<br>Nevada, USA | Construction quality assurance for liner/overliner installation for tailings management facility. |
| **Anchorage YMCA Site**<br>Alaska, USA | Designed a lightweight foundation for the storm drain system at the site. Design involved use of geofoam foundations for seating the storm drain system on peat. Manhole foundation was also designed with geotextile/geogrid reinforced soil embankment resting on underlying soft ground. |
| **Barrow-Atqasuk Powerline**<br>Alaska, USA | Involved in the conceptual geotechnical design of a powerline between Atqasuk and Barrow in Northern Alaska. Work includes design of a laboratory testing scheme for determining adfreeze strength of a fibre-reinforced polymer (FRP) pole material with slurry and estimating compressive strength of the polymer pole under compressive loads from freezing slurry. Laboratory testing was performed in a specially designed soil tank to estimate compressive hoop stresses acting on the FRP pole. Adfreeze strength between FRP and slurry was estimated by custom-designed direct shear tests. |
| **Indiana Department of Transportation**<br>West Lafayette, Indiana | Masters Thesis on geotechnical properties of tire shred-sand mixture for its use as backfill material for MSE walls. Determined the shear strength of the mixture and estimated the pullout resistance of various reinforcements embedded in the mixture. |
| **Indiana Department of Transportation**<br>Indiana, USA | Use of dynamic cone penetrometer testing for subgrade compaction control. Was involved in DCP testing and data collection across various sites in Indiana, for assessing the use of DCP in place of nuclear gauge testing for compaction control. |
| **Indiana Department of Transportation**<br>Indiana, USA | Analysis of geotechnical change orders in INDOT projects for 5 years between 2003 and 2007. A case-by-case investigation was carried out to determine the major geotechnical reasons for change orders in pavement and bridge construction projects. Tasks involved data analysis and geotechnical assessment of various change orders recorded in the 5-year period. |

## PROJECT EXPERIENCE – EARTHQUAKE/SEISMIC ENGINEERING

**High Commission of Canada Sites**
New Delhi, India

Performed a detailed site-specific seismic hazard analysis for the Canadian consulate building and the residence of the High Commissioner in New Delhi, as part of a retrofit effort on the structures. Used EZFrisk 7.6 to perform the deterministic and probabilistic seismic hazard analysis.

**Jack Hills Expansion Project**
Jack Hills, Australia

Performed seismic hazard analysis for a site located in Western Australia. Carried out deterministic and probabilistic seismic hazard analysis using EZFrisk 7.6, for the proposed expansion of mining and tailing facilities at the site.

**Confidential Client**
Jakarta, Indonesia

Part of the team performing probabilistic seismic hazard analysis for a land reclamation project. Involved in collecting and processing historic earthquake data and determining the seismic sources and source parameters, around the site.

**Fairbanks Natural Gas Plant**
Alaska, USA

Involved in the site-specific probabilistic seismic hazard analysis for a liquified natural gas tank located in Fairbanks

## PROJECT EXPERIENCE – RISK

**Confidential Client**
Southwest US, USA

Performed a preliminary risk assessment of 25-30 run-of-mine stockpiles under leaching. Tasks included collection and review of data from all stockpiles, performing geotechnical stability analysis using SLIDE, and risk evaluation based on stability, importance and consequence.

## PROJECT EXPERIENCE – PROJECT MANAGEMENT

**Morenci, AZ**
AZ, USA

Geotechnical assessment of a run-of-mine stockpile to assess its stability and the possibility of side-slope leaching. Project includes a field program for sonic drilling and sampling on the stockpile, piezometer installation, laboratory testing, stability and run-out analysis for the stockpile. Managed the entire project from proposal to issue of final report.

**Galena Park, TX**
Texas, USA

Geotechnical exploration and foundation design recommendations for the construction of a vapour construction unit near the ship channel. Managed the fieldwork, analysis and report writing for the project.

## TRAINING

***Houston Basic Plus Safety Training***
*Houston Area Safety Council, 12/2015*

***OSHA 40 hr HAZWOPER***
*Compliance Solutions, 12/2015*

***OSHA 10 hr Construction***
*Online, 2013*

***MSHA 24 hr training for surface, construction, metal and non-metal mining***
*Rio Tinto/US Borax Mine, Boron, CA, 2014*

## SUPPLEMENTAL SKILLS

***Professional Software and programming***
*SLIDE, GeoStudio, EZ-Frisk, gINT, Pygmy, Grapher, Kaleidagraph, Surfesis, EZstrobe and Minitab.*
*Programming: 'The Statistics R package' and C++.*

# Golder Associates Inc. – Houston

# Employment History

### *Golder Associates Inc. – Houston, TX*

*Field Technician (03/2015 to Present)*

Mr. Sylla's responsibilites include conducting environmental monitoring activities; soils and geosynthetics field observations and testing for containment system construction; construction observation, in-place soil testing, obtaining soil samples for laboratory testing, geosynthetic monitoring and other construction monitoring activities as needed;
Mr. Sylla also assistances with field work for geotechnical and other environmental projects.
*Concrete testing , in accordance with ASTM regulations.
*Soil tesing in the lab in accordance with ASTM regulations.
*Lab sample shipment and data sheet completion while in the field.
*Proper field form docu entation for reporting purposes.
*Communication with Project Managers for all aspects of work load.
*Preparation of project JSAs prior to starting field related activities.

### *Fugro Roadware – Houston, TX*

*Field Service Technician (02/2014 to 01/2015)*

Mr. Sylla operated and maintained multi computerized data acquisition systems to collect real time data over roadways. His responsibilities included meeting data collection quotas accurately, daily vehicle and test equipment checks, calibrations, operation, data QC checking, processing and storage, completing scheduled maintenance and data shipments and associated administrative work. He also developed data collection routes in different areas to facilitate collection, performed regular surveys and facilitated collection data, and performed daily vehicle and test equipment checks, calibrations, operation, data QC checking, processing and storage, completing scheduled maintenance and data shipments and associated administrative work. Mr. Sylla monitered various collection areas. He was responsible for troubleshooting computers and any associated electronics, and preparaing JSAs prior to starting field related activities.

### *Transcore – Houston, TX*

*Field Service Technician (03/2013 to 01/2014)*

Mr. Sylla's was responbile for the installation, preventive and corrective maintenance of equipment including but not limited to traffic controllers, CCTV cameras, switches, fiber optic patch panels, cabling, various terminal blocks, roadway signage and lighting. He assisted in repairing HOV lane equipments to operational status as quickly as possible. His responsibilites also included traffic control placement in high or low speed environments, installation, preventive and corrective maintenance of toll collection equipment to include computers, video surveillance equipments and network communication equipments. He was also responsible for completing reports, logs and performing shift-to-shift communications in accordance with established policies, reporting technical status of system with accuracy and completeness. Mr. Sylla maintained spare

equipment and parts including inventory management and filed work orders electronically.

### *TD Williamson Inc. – Houston, TX*

*Field Service Technician (02/2012 to 08/2012)*

Mr. Sylla was responsible for basic troubleshooting, installation, maintenance and service repair needs on pipeline inspection tools. He assembled mechanical components and electrical wiring to test inspection tools. Mr. Sylla also prepared project logistics, managed front-end and back-end mobilation phases, and supervised survey execution in regards to both company personnel and client personnel. More repsonsbilites included launching and receiving the inspection tools in accordance to the client's specifications, validating the survey data and check for completeness and whether the quality is sufficient for data processing, facilitating all pre-job safety meetings with the client and contractors, completing all field reports for data evaluation, and preparing project JSAs prior to related field activities.

### *Rosen USA Inc. – Houston, TX*

*Field Service Technician (05/2009 to 12/2011)*

Mr. Sylla launched and received pipeline inspection tools on onshore and offshore. He was also responsible for pipeline cleaning services using corrosion tools such as MFL, GEO, CDP, AFD, EGP, UT and EMAT. As a field technician, Mr, Sylla facilitated all pre-job safety meetings with clients and contractors, performed site visits and briefings with the client onsite representative to clarify the inspection run circumstances, especially the launching and receiving as well as inspection tool tracking. He also prepared and maintained all equipment used in safety and compliance testing, generated and prepared inspection data for data analysis, verified proper utilization of marker boxes and assisted clients with locating stuck tools and abnormal operations. Mr. Sylla prepared documentation on run reports, repairs needed, and repairs completed.

### *GE Oil and Gas/Granite Services – Houston*

*Field Service Technician (01/2006 to 07/2007)*

Mr. Sylla was responsible for assessing the inspection tool condition and performing reconditioning when applicable, performing preventative maintenance, bench and field repair, diagnosis and part ordering, rebuilding and preparing pipeline inspection tools for projects, and performing mechanical and electronic repairs on various MFL tools. Mr. He also prepared and maintained paperwork for each project which included detailed documentation concerning the condition of equipment, repairs needed and repairs completed

## PROJECT EXPERIENCE – CONSTRUCTION QUALITY ASSURANCE

# Golder Associates Inc. – Houston

# Employment History

***Golder Associates Inc. – Houston, Texas***

*Engineering Technician (September 2003 to Present)*

Resident CQA Manager and CQA Technician during construction of composite lining systems at solid and hazardous waste landfill facilities in Michigan, Virginia, Louisiana and Texas. Responsibilities on these projects include management of field data, monitoring construction/installation of the soil and synthetic lining systems, communication with client and contractor, and assistance with report preparation. Experience totaling over 9.5 million square feet of geomembrane installation, 1,000 cubic yards of concrete placement, and over 200 thousand cubic yards of soil placement. Also, conducted a variety of soil tests at the Golder Associates laboratory in Houston, Texas. Established horizontal and vertical control for site development and aerial controls. Provided client with construction staking for site. Collected as-built data for completion of CQA Reports.

Specific Project Responsibilities include:

- Resident CQA Manager, Chemical Waste Management, Lake Charles, Louisiana
- Resident CQA Manager, Solid Waste Landfill, Galveston, Texas
- Resident CQA Manager, Greenshadow Landfill, Pasadena, Texas
- Resident CQA Manager, Edinburg Municipal Landfill, Edinburg, Texas
- Resident CQA Manager, Coastal Plains Recycling and Disposal Facility, Alvin, Texas
- Resident CQA Manager, Cougar Construction Debris Landfill, Houston, Texas
- Resident CQA Manager, King George County Landfill, King George, Virginia
- Resident CQA Manager, Love Landfill, Bad Axe, Michigan
- Resident CQA Manager, Jasper Creosoting Superfund Site, Jasper, Texas
- MQA Monitor, GSE, Houston, Texas
- MQA Monitor, CETCO, Lovell, Wyoming

## Education

*Bachelor of Science Civil Engineering, Prairie View A&M University, Prairie View, TX, 2015*

## Certifications

*CQA Compacted Clay Liner Inspector, 04/29/2016*

*HAZMAT Training , 06/08/2015*

# Golder Associates Inc. – Houston

***Field Engineer***

Daniel Williams is Field Engineer with 1 year of experience at Golder Associates in Houston. In addition to experience performing Construction Quality Assurance (CQA), Daniel is a certified nuclear density gauge operator and has experience testing soils and asphalt. Before joining Golder Daniel attended Prairie View A&M University where he earned a Bachelor of Science in Civil Engineering. While in college, Daniel gained summer employement as an intern at Waste Management where he gained exposure to landfill gas management systems, landfill construction, and environmental compliance.

# Employment History

***Golder Associates – Houston, TX***
*Field Engineer (2015 to Present)*

Provide Construction Quality Assurance (CQA) on various earthwork projects.

Procure and document various material samples as needed per CQA plan.

Perform field testing of various construction materials as needed.

Communicate with clients, contractors, and senior Golder staff members as needed to prevent and resolve issues.

***Waste Management, Inc. – Houston, TX***
*Engineering Intern (2013 to 2014)*

Revised sketches to redirect work of consultants and contractors.

Created and edited gas system schematics using computer software.

Performed quality assurance on landfill gas monitoring system.

Performed quality assurance on greenhouse gas reporting system.

Created Excel macros to update 2013-14 financials.

## PROJECT EXPERIENCE – CONSTRUCTION QUALITY ASSURANCE

| | |
|---|---|
| **Roseburg Forest Products Dillard Landfill**<br>Douglas County, OR | Closure of a wood waste landfill which included the construction of 1400ft gabion retaining wall, ditch construction, drainage ditch and culvert installations, and soil capping. |
| **Luminant Oak Grove Power Plant**<br>Robertson County, TX | Construction of a 26-Acre coal ash landfill cell which included construction of a containment dike, installation of 3-foot thick clay liner, and tie-in to adjacent cell existing clay liner. |

# Golder Associates Inc. – Jacksonville

***Geologist***

Mr. Kendall is a geologist in the geosciences group located at the Jacksonville office and has been with the firm since June, 2013. His primary practice areas are taking part in field efforts and supporting numerous projects including comprehensive environmental response, compensation and liability act (CERCLA) and resource conservation and recovery act (RCRA) sites, petroleum facilities, dry cleaning facilities, landfills, and voluntary clean-up programs for acquisition by private sector clients.

# Employment History

***Golder Associates – Jacksonville, FL***

*Geologist (2013 to Present)*

Geologist from June 2013 to present.

***Tetra Tech – Whitehouse Station, NJ***

*Staff Geologist (2012 to 2013)*

Staff Geologist from March 2012 to May 2013.

## PROJECT EXPERIENCE – MINING

**Midway Mine**
NV, USA

Assisted in soil sampling and soil lab testing, soil density and moisture testing, concrete and excavation oversight of multiple subcontractor teams, liner quality testing of destructs, and health and safety oversight.

## PROJECT EXPERIENCE – CONSTRUCTION QUALITY ASSURANCE

**Gillette Dig**
TX, USA

Assisted in CQA to backfilling of a soil excavation by testing the density of soil and sampling the backfilled soil.

## PROJECT EXPERIENCE – LANDFILL

**Austin Community Landfill**
TX, USA

Sole oversight of several subcontractor teams for excavation of new landfill cell expansion. Was responsible for moisture and density testing of backfill soil of new cell expansion, and sole correspondent between subcontractor teams, Golder, and landfill crews.

**Twin Valley**
PA, USA

Provided assistance with onsite landfill water sampling using monitoring wells, as well air monitoring using methane and other gas detection and monitoring, as well as leachate sampling.

## PROJECT EXPERIENCE – CONSTRUCTION QUALITY ASSURANCE

**Alcatel-Lucent Demo**
NJ, USA

Gathered and collected concrete samples from numerous on site locations to determine impacts of potential contaminants so that the building on site could gain permission to be demolished.

## PROJECT EXPERIENCE – HYDROGEOLOGY

**Pfizer Carolina**
Puerto Rico, USA colony

Oversaw drilling subcontractor team perform several new well installations at various depths while performing well developments and numerous well sampling across the entire site to determine the extent of the contaminated groundwater plume.

**Folcroft**
PA, USA

Assisted with installation of several temporary wells and borings to assess the extent of a contamination plume in Philadelphia PA. Soil boring, rock coring, and water sampling of numerous locations were undertaken over a period of 4 weeks.

**Kearny**
NJ, USA

Provided oversight of deep overburden and bedrock monitoring wells to determine the extent of a contaminated groundwater plume in NJ. Provided oversight of subcontractor teams which installed numerous monitoring and injection wells which were then used for a bedrock injection pilot study and soil cap using injected hydrogen peroxide.

## PROJECT EXPERIENCE – ENVIRONMENTAL ASSESSMENT

| | |
|---|---|
| **Former Ethio**<br>FL, USA | Lead Field Geologist responsible for directing subcontracted drilling team while overseeing numerous groundwater well installs, vault abandonments, well abandonments, soil boring sample collection and groundwater well development and sample collection. |
| **Caldwell Superfund sight**<br>NJ, USA | Provided groundwater sampling and monitoring on an extensive list of sampling parameters on a site with difficult site access issues. |
| **L+D Landfill**<br>NJ, USA | Performed groundwater sampling using multiple water extraction methods, while working with challenging environmental and site factors such as difficult site access and well location. |
| **Trinity**<br>PA, USA | Assisted in coil sampling and testing, dust monitoring, air quality monitoring, and excavation oversight |
| **Exide Tampa**<br>FL, USA | Took several soil boring samples at numerous locations and depths to determine the extent of contamination impacts |
| **Malnove**<br>FL, USA | Groundwater Sampling in Jacksonville, FL of numerous wells to determine the extent of impacted groundwater. |
| **Quincy Phase I**<br>FL, USA | Performed a phase I assessment of a cellular tower in Quincy Florida. Numerous photographs were taken and analysed to determine the extent of any potential contamination sources. |
| **Trinity PA**<br>PA, USA | Provided oversight of subcontractor teams during an excavation of PCB and VOC impacted soil. Also assisted in soil sampling in Level D and C. Assisted with onsite air monitoring and Industrial hygiene. |
| **Bayer New Brunswick**<br>NJ, USA | Provided on site assistance with Vapour Intrusion drilling, setup, and sampling over a period of months to determine the extent of a contamination plume in a mixed residential and commercial area. |
| **DS+G**<br>DE, USA | Helped manage and sample over 70 monitoring wells using Low-Flow groundwater sampling at the DS+G Superfund site in New Castle, Delaware. |

## PROJECT EXPERIENCE – ENVIRONMENTAL MANAGEMENT

| | |
|---|---|
| **Bayer Whippany**<br>NJ, USA | Provided oversight of several subcontractor teams undertaking a large scale excavation of PCB impacted soil and sediment and subsequent delineation while following strict EPA and NJDEP regulations. |

# Golder Associates Inc. – Houston

***Civil Engineer***

Alexandra is a registered engineer in training (EIT) in Colorado with a bachelor of science in Civil Engineering from the Colorado School of Mines (CSM) and 5 years of experience as a civil engineer with civil and environmental consulting companies. Alex is currently pursuing a master of science degree in Civil Geotechnical Engineering from CSM which will be completed in December, 2015.

Alex's experience comprises of performing geotechnical investigations, data analysis, engineering design, and on-site construction quality assurance and control for various mining structures such as water diversion channels, heap leach facilities, and earthen dams. Since relocating to Texas in 2015, Alex has been focusing on solid waste management facility analysis, design, and construction.

# Employment History

***Golder Associates – Houston, TX***

*Civil Geotechnical Engineer (2015 to Present)*

Conducting geotechnical analyses and assisting in various aspects of the design and construction of landfills.

***Knight Piesold and Co. – Denver, CO***

*Civil Engineer/Scientist (2010 to 2015)*

Performed geotechnical investigations, data analysis, engineering design, and on-site construction quality assurance and control for various mining facilities such as water diversion channels, heap leach facilities, and earthen dams.

## PROJECT EXPERIENCE – CONSTRUCTION QUALITY ASSURANCE

| | |
|---|---|
| **Baytown Landfill**<br>Houston, Texas, USA | Provided CQA at Baytown for approximately 90,000 sq. ft. of geomembrane liner installation. |
| **Minas Conga**<br>Cajamarca, Peru | Provided construction quality assurance for close-out construction details of the Chailhuagon Sediment Pond and Chailhuagon Reservoir. The close-out construction occurred in the spillway, outlet works, and downstream embankment face areas. |
| **Fort Knox Mine**<br>Fairbanks, Alaska | Provided construction quality assurance and quality control (CQA/QC) services to the Stage 3 and 4 Walter Creek Valley Heap Leach Pad expansions during the 2011 and 2012 construction seasons and to a raise on the Tailings Storage Facility in 2011. CQA/QC involved checking for compliance with the intent of design, compliance with Earthwork Specifications (regarding spreading, layer thickness, and material gradation), geomembrane installation inspections, and supervision of an on-site soils laboratory. On-site soils laboratory responsibilities included performing sieve analysis of fine and coarse aggregates and proctor/moisture-density relationship testing to confirm soil compliance with design specifications. Experienced both dayshift and nightshift activities on both facilities.<br><br>Collaborated with a team of engineers during completion of the Stage 3 Construction Completion Report drawing set (representing 2011 construction progress). Prepared the Stage 4 Construction Completion Report drawing set (representing 2012 construction progress). Compiled appendix data and field data summary tables for the Stage 3 and 4 Completion Reports. Developed an initial budget estimate and proposal for the 2013 construction season. For Kinross Gold. |

## PROJECT EXPERIENCE – GEOTECHNICAL ENGINEERING

| | |
|---|---|
| **Galena Park**<br>Texas/Houston, USA | Provided drilled shaft construction observation and geotechnical engineering support services. |
| **Round Mountain Gold Mine**<br>Nevada/Nye County, USA | Supervised geotechnical pneumatic core drilling, core logging, in-situ testing, and sampling. Performed Standard Penetration Tests, using mostly split spoon samplers and occasional modified California samplers. For Kinross Gold. |
| **Gramalote Project**<br>Antoquia/San Roque, Colombia | Analyzed lab testing data and reconciled results with borehole and testpit logs provided from the field. Assisted in characterization and analysis of the foundation material for the Tailings Management and Waste Rock Facilities. For AngloGold Ashanti. |

## PROJECT EXPERIENCE – GEOPHYSICS

| | |
|---|---|
| **Georgia-Pacific Gypsum**<br>Texas/Sweetwater, USA | Assisted in using Ground Penetrating Radar (GPR) and Multichannel Analysis of Surface Waves (MASW) to map the location of potential voids near the gypsum plant. |

## PROJECT EXPERIENCE – TAILINGS

**Yellowknife Gold Project**
Yellowknife, Canada

Conducted storage capacity analyses on various tailings storage facility arrangements. Established design details such as dam heights, pipeline routes, and a preliminary staging plan for the conceptual layout of the Tailings Storage Facility during the Project Feasibility Study. For Tyhee NWT Corp.

**Pinos Altos Mine**
Chihuahua/Pinos Altos, Mexico

Supervised on-site cone penetrometer testing performed by ConeTec personnel to get additional information for slope stability analyses and to identify zones in which it might be beneficial to instill a wick drain program in the tailings storage facility. For Agnico Eagle Mines.

**La Colosa Project**
Tolima, Colombia

Created design drawings, conducted storage capacity analyses, established material quantity takeoffs, and budget estimates for various tailings storage facilities during the development of a Mining Methods Alternatives Assessment. For AngloGold Ashanti Colombia S.A.

## PROJECT EXPERIENCE – DAM ENGINEERING

**Minas Conga**
Cajamarca, Peru

Minas Conga is a copper and gold porphyry deposit which currently consists of water retaining structures and future construction is on hold due to civil unrest. Alex compiled and assisted with review of field data as the basis for design of zoned earthfill dams during the geotechnical investigation of the Chailhuagon Sediment Pond, Chailhuagon Reservoir, and Perol Reservoir. During design, updated Final Design Report and Technical Specifications Report to reflect most current design changes. Performed gradation design of sand and gravel filters as a part of updating Perol Reservoir's technical specifications. After construction, travelled onto site to complete quality assurance for close-out construction details of the Chailhuagon Sediment Pond and Reservoir. Co-wrote and compiled the Chailhuagon structures' Construction Completion Reports. Developed Operation, Maintenance, and Surveillance Manuals for both Chailhuagon structures. For Minera Yanacocha S.R.L.

## PROJECT EXPERIENCE – MINING

**Carlota Mine**
Arizona/Gila County, USA

Carlota is an open-pit copper mine preparing for mine closure. Alex identified catchment areas to be applied in water balance modelling for the Pit Lake closure plan. Conducted storage capacity analyses on the PLS and Raffinate ponds affecting the Pit Lake's final volume. For KGHM International.

**Constancia Project**
Chumbivilcas/Chilloroya, Peru

Wrote an initial revision of the Construction Completion Reports for the Water Diversion Channels, Tailings Management Facility, Bog Storage Facility, and Waste Rock Facility. Lived on-site in order to more effectively communicate and collaborate with the field engineers while observing the structures and their construction. For Hudbay Minerals.

## SUPPLEMENTAL SKILLS

***Microsoft Office Suite***

***Auto-CAD Civil 3D***

***gINT***

*Adept with gINT, the geotechnical software currently used for reporting borehole and well logs, fence diagrams, geotechnical testing and other engineering data.*

***Phase2 Tunnel Design Software***

# FLEXIBLE WALL TRIAXIAL PERMEABILITY

ASTM D 5084 METHOD F, CONSTANT VOLUME - FALLING HEAD

| | | | | |
|---|---|---|---|---|
| PROJECT TITLE: | LUMINANT/OAK GROVE LF 1 CELL 2/TX | Cell Pressure = | 80 | psi |
| PROJECT NUMBER: | 113-94788 | Backwater Pressure = | 70 | psi |
| SAMPLE ID: | QCL-2-4 | Run Number = | 1 | |
| LIFT NUMBER: | | | | |

| **Sample Data, Initial** | | inches |
|---|---|---|
| Height, cm | 8.38 | 3.298 |
| Diameter, cm | 7.25 | 2.853 |
| Area, $cm^2$ | 41.24 | |
| Volume, $cm^3$ | 345.50 | |
| Wet Mass, g | 620.9 | |
| Wt. wet soil + tare, gm | 154.80 | |
| Wt. dry soil + tare, gm | 128.50 | |
| Wt. tare, gm | 8.3 | |
| Moisture Content, % | 21.9% | |
| Dry Density, pcf | 92.0 | |
| Specific Gravity | 2.7 | |
| Void Ratio | 0.83 | |
| Saturation, % | 71.1% | |
| Effective Stress, psi | 10 | |

**Initial Manometer Readings**

Pipette = 27.8

Annulus = 0.85

**Calculation Constants:**

**Manometer Constants:**

$M_1$ = 0.03 $cm^2$

$M_2$ = 1.04

**Sample Constants:**

S = 0.20 $cm^{-1}$

**Specific Gravity Constant:**

G = 12.56

**Test Constant:**

C = 0.0005

$T = M_2/z_1$

where $z_1$ = Pipette reading - annulus reading for each time step

| **Sample Data, Final** | | inches |

Notes:
1. In situ values determined by nuclear methods: ASTM D-2922 for density and D-3017 for moisture content.
2. "PASS" indicates both a percent compaction exceeding the minimum required compaction (95% Max Dry Density) and a moisture content of -3 to +3 of the optimum moisture content.

Notes:
1. In situ values determined by nuclear methods: ASTM D-2922 for density and D-3017 for moisture content.
2. "PASS" indicates both a percent compaction exceeding the minimum required compaction (95% Max Dry Density) and a moisture content of +2 to +6 of the optimum moisture content.

# Quality Assurance Laboratory Test Results

**Job Name:** LSL Oak Grove Station
**Sales Order:** 76398

**Required Testing:** ASTM D 3895 -- Standard Test Method for Oxidative Induction Time of Polyolefins by Differential Scanning Calorimetry
ASTM D 5397 -- Standard Test Method for Evaluation of Stress Crack Resistance of Polyolefin Geomembranes Using Notched Constant Tensile Load Test

**Specification:** D 3895 - > 100 Minutes
D 5397 - > 300 Hours

| Product Code | Resin Lot Number | Test Results |
|---|---|---|
| HDT-060GE-BBB-B-W0 | HFG820880 | PASS |
| HDT-060GE-BBB-B-W0 | HFG820860 | PASS |

GSE ENVIRONMENTAL

# Quality Assurance Laboratory Test Results

**Job Name:** LSL Oak Grove Station
**SO Number:** 76398

The table below summarizes additive performance of GSE Houston products as perceived by OIT retention after UV and Oven Aging per GRI Test Method GM13:

| | | Oven Aging @ 85° C (ASTM D 5721) | | | | UV Resistance per GRI GM11 | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | 90 days per ASTM D 5885 | | | | 1600 hours UV Aging per ASTM D 5885 | | | |
| **Product Type** | **Formulation** | Initial HP OIT (min) | Final HP OIT (min) | Retained (%) | GRI Criteria (%) | Initial HP OIT (min) | Final HP OIT (min) | Retained (%) | GRI Criteria (%) |
| HDPE Geomembrane | Chevron Phillips Marlex® K306 + Carbon Black | 697 | 661 | 94 | 80 | 697 | 565 | 81 | 50 |

Approved By: Debra Gortemiller

# APPENDIX N
# PHOTOGRAPH LOG

At Golder Associates we strive to be the most respected global group of companies specializing in ground engineering and environmental services. Employee owned since our formation in 1960, we have created a unique culture with pride in ownership, resulting in long-term organizational stability. Golder professionals take the time to build an understanding of client needs and of the specific environments in which they operate. We continue to expand our technical capabilities and have experienced steady growth with employees now operating from offices located throughout Africa, Asia, Australasia, Europe, North America and South America.

# 1.0 INTRODUCTION

Oak Grove Management Company LLC (Oak Grove) owns and operates the Oak Grove Steam Electric Station (OGSES) located approximately ten miles north of Franklin in Robertson County, Texas. The power plant and related support areas are located along the south side of Twin Oak Reservoir (Figure 1). The OGSES consists of two lignite-fired units with a combined operating capacity of approximately 1,796 megawatts. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operation. The CCRs are transported off-site for beneficial use by third-parties or are disposed at the OGSES Ash Landfill 1.

The U.S. Environmental Protection Agency promulgated 40 C.F.R. Part 257, Subpart D (the CCR Rule) and the Texas Commission on Environmental Quality (TCEQ) promulgated 30 T.A.C. Chapter 352 (which largely adopts the federal CCR Rule by reference) to establish technical requirements for new and existing CCR landfills and surface impoundments. On June 28, 2021, USEPA approved the majority of TCEQ's CCR program, which will now operate in lieu of the federal regulations. FGD-A, FGD-B, and FGD-C (collectively the "FGD Ponds") at the OGSES have been identified as Existing CCR Surface Impoundments regulated under the CCR Rule.

Section 257.73(a)(2) specifies that periodic Hazard Potential Classification Assessments (HPCAs) be performed by a qualified professional engineer for each existing CCR surface impoundment and 30 T.A.C. 352.731 adopts this requirement by reference. In accordance with § 257.73(f)(1) of the CCR Rule, the initial HPCA for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016). As specified in §257.73 (f)(3), the HPCAs must be updated every five years from the completion date of the initial plan. Golder Associates Inc., member of WSP (Golder), was retained by Oak Grove to prepare this updated HPCA for the FGD Ponds.

## 1.1 CCR Surface Impoundment Hazard Potential Classification Assessment Requirements

Section 257.73(a)(2) specifies that periodic hazard potential classification assessments be performed for each existing CCR surface impoundment. The hazard potential classification assessments must document the hazard potential classification of each CCR impoundment as either:

- A high hazard potential CCR surface impoundment,
- A significant hazard potential CCR surface impoundment, or
- A low hazard potential CCR surface impoundment.

The assessments must document the basis for each hazard potential classification and must be certified by a qualified professional engineer confirming that the hazard potential classifications were conducted in accordance with the requirements of § 257.73(a)(2).

## 1.2 OGSES Surface Impoundments Subject to Hazard Potential Classification Assessments

Section 257.53 defines CCRs as "fly ash, bottom ash, boiler slag, and flue gas desulfurization materials from burning coal for the purpose of generating electricity by electric utilities and independent power producers". The hazard potential classification assessment requirements of the CCR Rule apply to surface impoundments that dispose or otherwise engage in solid waste management of CCRs.

The FGD Ponds have been identified as CCR Units subject to the hazard potential classification assessment requirements at the OGSES.

## 1.3 Description of FGD Ponds

The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (Figure 2) and are constructed above grade and surrounded by engineered earthen dikes that extend up to approximately 25 feet above surrounding grade.

The FGD Ponds receive wastewater from the FGD wet scrubber system blowdown, low volume wastewater, bottom ash contact water, and storm water runoff from part of the power plant area. All fluids are pumped into the FGD Ponds and there are no uncontrolled or gravity inflows into the ponds, with the exception of a gravity overflow from FGD-A to FGD-B. Process wastewater can be transferred between the FGD Ponds and is used as makeup water to the FGD scrubber system and related purposes. The are no spillways or other uncontrolled gravity flow releases from the ponds. Solids that accumulate in the FGD ponds are periodically removed and transported to OGSES Ash Landfill 1.

FGD-A covers an area of approximately 9 acres and was constructed in 2008. FGD-A is currently lined with a 3-foot thick compacted clay liner; however, FGD-A ceased receipt of waste by April 11, 2021, and Oak Grove has initiated the retrofit of FGD-A with a composite liner system meeting the requirements of § 257.71(a)(1)(ii). The retrofitted liner system will consist of a minimum 2-foot thick compacted clay liner or geosynthetic clay liner (GCL), overlain be a 60-mil HDPE geomembrane liner. The floor of the pond will be covered by a 1.5-foot thick layer of protective soil and the upper portion of the pond side slopes will be covered with concrete revetment mat.

FGD-B covers an area of approximately 11.2 acres and was constructed in 2011. FGD-B is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain be a 60-mil HDPE geomembrane liner, overlain by a 1-foot thick layer of protective soil. The composite liner system in FGD-B complies with the requirements of §257.71(a)(1)(ii).

FGD-C is approximately 15.2 acres and was constructed in 2016. FGD-C is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner, overlain by a 2-foot thick soil/ash protective layer. The composite liner system in FGD-C complies with the requirements of §257.71(a)(1)(ii).

Based on available construction data, the FGD Ponds were constructed to provide the following estimated storage capacities:

- FGD-A: 190 acre-feet,
- FGD-B: 125 acre-feet, and
- FGD-C: 248 acre-feet.

## 1.4 USACE Size Classification for FGD Ponds

The US Army Corps of Engineers (USACE) classifies the relative size of dams based on the height of the dam and the storage capacity of the impounded area behind the dam as follows (USACE, 1979):

| USACE Dam Size Classification | | |
|---|---|---|
| **Size Category** | **Impoundment Capacity (acre-ft)** | **Impoundment Height (ft)** |
| Small | 50 and < 1,000 | 25 and < 40 |
| Intermediate | 1,000 and < 50,000 | 40 and < 100 |
| Large | > 50,000 | > 100 |

Based on the dike heights and operating capacities of the FGD Ponds, these ponds are categorized as small impoundments based on the USACE dam size classification criteria.

## 1.5 Previous Hazard Potential Classification Assessments for FGD Ponds

The following Hazard Potential Classification Assessments were previously performed for the FGD Ponds:

- **Initial Hazard Potential Classification Assessment, 2016**. As required under § 257.73(a)(2), the initial Hazard Potential Classification Assessment for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016). The FGD Ponds were classified as **LOW** hazard potential CCR surface impoundments, since a failure or mis-operation of the impoundments results in no probable loss of human life, low economic and/or environmental losses, and no significant disruption of lifeline systems.
- **EPA Hazard Potential Classification Assessment, 2014**. In 2009, the EPA initiated a program to assess the stability and functionality of coal ash impoundments at coal-fired electric generating plants across the United States. The assessment of the stability and functionality of the OGSES FGD Ponds was performed by O'Brien and Gere (OBG) on behalf of EPA (OBG, 2014). The FGD Ponds were classified as **LOW** hazard potential CCR surface impoundments in the 2014 OBG assessment.

## 2.0 CCR HAZARD CLASSIFICATION ASSESSMENT METHODOLOGY

As defined in § 257.53, hazard potential classification means the possible adverse incremental consequences that result from the release of water or stored contents due to failure of a diked CCR surface impoundment or mis-operation of the diked CCR surface impoundment or its appurtenances. Hazardous potential classifications for CCR surface impoundments include high hazard potential CCR surface impoundment, significant hazard potential CCR surface impoundment, and low hazard potential CCR surface impoundment, which are defined in the CCR Rule as follows:

- High Hazard Potential CCR Surface Impoundment. A diked surface impoundment where failure or mis-operation will probably cause loss of human life.
- Significant Hazard Potential CCR Surface Impoundment. A diked surface impoundment where failure or mis-operation results in no probable loss of human life, but can cause economic loss, environmental damage, disruption of lifeline facilities, or impact other concerns. FEMA considers lifeline facilities to include transportation facilities (highways, airports, ports, trains), electric power, water and sewer, communications (telephone, TV, radio, electronic) and gas and liquid fuel pipelines (FEMA, 1995).
- Low Hazard Potential CCR Surface Impoundment. A diked surface impoundment where failure or mis-operation results in no probable loss of human life and low economic and/or environmental losses. Losses are principally limited to the surface impoundment owner's property.

The hazard classification assessment for the FGD Ponds was performed using the methodology presented in Federal Guidelines for Dam Safety: Hazard Potential Classification System for Dams developed by the Federal Emergency Management Agency (FEMA, 2004). The FEMA guidelines classify dams into similar hazard potential categories to those defined in the CCR Rule (low hazard potential, significant hazard potential and high hazard potential) and the FEMA guidelines are listed in the Preamble to the CCR Rule as one of the technical resources considered by EPA during development of the CCR Rule.

The FEMA hazard potential evaluation is based on assessing the probable loss of human life and the potential for economic losses, environmental damage, and/or disruption to lifelines caused by failure or mis-operation of a dam or its appurtenances. The location/size of the dam and impoundment area is evaluated against development, occupancy and land use conditions in areas downstream of the dam/impoundment that would be affected by a failure of the dam and release of the impounded water. The FEMA evaluation recognizes that the failure of any dam or water-retaining structure, no matter how small, represents a potential danger to downstream life and property and there is always the possibility of someone being in the path of the resulting discharge. However, the FEMA evaluation recognizes that considering every conceivable circumstance that might remotely place a person in the area potentially inundated as a result of the dam failure should not be the basis for determining the hazard classification level of the dam/impoundment. The FEMA evaluation considers "probable loss of life" to exist where persons are permanently located in the area potentially inundated as a result of the dam failure.

The hazard classification of the FGD Ponds was assessed by identifying the development, occupancy and land use characteristics of potentially affected areas downstream of the impoundments. The assessment included a review of available aerial photographs, USGS topographic maps, interviews with Oak Grove personnel familiar with the area, and similar resources. Classification of the FGD Ponds in accordance with the FEMA hazard potential criteria is based on the assessment of probable loss of human life and the potential for economic losses, environmental damage, and/or disruption to lifelines caused by failure of the embankments surrounding the ponds.

# 3.0 UPDATED HAZARD POTENTIAL CLASSIFICATION ASSESSMENT FOR FGD PONDS

The hazard potential classification of the FGD Ponds was assessed by identifying the development, occupancy and land use characteristics of areas downstream of the impoundments, assessing the probable loss of human life and/or the potential for economic losses, environmental damage, and/or disruption to lifelines caused by failure of the embankments surrounding the impoundments, and using the results of the assessment to classify the impoundments based on the FEMA hazard potential criteria described in Section 2.0 of this report.

## 3.1 Areas Downstream of FGD Ponds

The OGSES is located approximately ten miles north of Franklin, Texas and borders the south side of the Twin Oak Reservoir (Twin Oak). Twin Oak is a man-made reservoir that was constructed in 1982 to provide cooling water for the OGSES. Oak Grove owns the water rights to the lake and operates and maintains Twin Oak Dam. The emergency spillway of the dam is approximately 407 ft. above mean sea level (MSL) with a normal lake (conservation pool) elevation of 401 ft. MSL. At the conservation pool elevation, Twin Oak covers an area of approximately 2,330 acres, and contains a total volume of approximately 30,319 acre-ft of water (TWDB, 2021).

The FGD Ponds are located on the western edge of the OGSES and border Twin Oak Reservoir (see Figure 2). In the immediate vicinity of the FGD Ponds, Twin Oak Reservoir is subdivided into the following hydraulically connected areas separated by berms that extend 5 to 10 feet above the normal pool elevation:

- Upper Secondary Discharge Pond (Normal Pool Elevation of 410 ft. MSL, Area of approximately 80 acres), and
- Secondary Discharge Canal (Normal Pool Elevation of 410 ft. MSL, Area of approximately 270 acres).

The FGD Ponds are located adjacent to the Upper Secondary Discharge Pond. A berm separates the Upper Secondary Discharge Pond from the Secondary Discharge Canal, which are hydraulically connected by culverts through the berm. A second berm separates the Secondary Discharge Canal from the main body of Twin Oak Reservoir with the Tertiary Discharge Canal allowing flow to the main reservoir at a controlled rate. A potential release from the FGD Ponds would flow into Upper Secondary Discharge Pond, then into the Secondary Discharge Canal, then into the main body of the reservoir.

The shoreline of Twin Oak is mostly undeveloped and there are no permanent residences along the lake shoreline. Oak Grove owns all property immediately adjacent to the lake.

No gas or petroleum pipelines traverse Twin Oak Reservoir (RRC, 2021). Other than Oak Grove service roads that transverse the tops of the berms that run along the downstream edges of the Upper Secondary Discharge Pond and the Secondary Discharge Canal, no public roadways and no railroads cross the reservoir.

## 3.2 Hazard Potential Classification Assessment

A failure of the dikes surrounding the FGD Ponds would release CCR solids/fluids that would flow north toward Upper Secondary Discharge Pond, then potentially into the Secondary Discharge Canal, then potentially into Twin Oak Reservoir. As described in Section 1.3 of this report, the operating volume of the largest of the FGD Ponds (FGD-C) is approximately 248 acre-ft. In the unlikely event that the entire volume of FGD-C is released through catastrophic failure of the dikes, the solids/fluids would first flow into and be equalized by the Upper Secondary Discharge Pond, then flow into and be equalized by the Secondary Discharge Canal. Even if the total volume of FGD-C were to pass from the Secondary Discharge Canal to the main body of Twin Oak, the total volume of

FGD-C (248 acre-ft) represents less than one percent of the conservation pool volume of Twin Oak (30,319 acre-ft). Assuming a lake surface area of 2,330 acres at the conservation pool elevation of 401 feet, the total volume of FGD-C would raise the lake level by approximately 0.11 feet or slightly more than one inch. The resulting water surface elevation (401.11 feet) is well below the emergency spillway elevation at Twin Oak Dam (407 feet), indicating that the total volume of FGD-C would be retained and equalized within Twin Oak.

Using the FEMA hazard potential criteria described in Section 2.0 of this report, the projected effects of catastrophic failure or mis-operation of the impoundments results in a hazard potential classification of **LOW** for the FGD Ponds. This classification is supported by the following:

- No Probable Loss of Human Life. FEMA considers "probable loss of life" to exist where persons are permanently located in the area potentially inundated as a result of dam failure. The shoreline of Twin Oak Reservoir is mostly undeveloped and there are no permanent residences along the lake shoreline. In addition, the total volume of the largest FGD Pond (FGD-C) would be retained and equalized in Upper Secondary Discharge Pond, the Secondary Discharge Canal and/or the main body of Twin Oak. If the total volume of FGD-C were to pass into the main body of Twin Oak, the reservoir level would be raised by approximately 0.11 feet, which is well below the emergency spillway elevation of Twin Oak Dam. As a result, a release from the FGD Ponds would result in no probable loss of human life.

- Low Economic and/or Environmental Losses. FEMA considers low economic and or environmental losses to occur when losses resulting from a dam failure are principally limited to the dam owner's property. Since Oak Grove owns the water rights to Twin Oak Reservoir and the land surrounding the lake, any losses would primarily be limited to the Oak Grove property.

- No Significant Disruption of Lifelines. There are no gas/petroleum pipelines, public highways or railroads that traverse Twin Oak Reservoir. Therefore, no lifelines would be affected by a release from the FGD Ponds.

# 4.0 FINDINGS OF UPDATED HAZARD POTENTIAL CLASSIFICATION ASSESSMENT

Golder was retained by Oak Grove to perform the 5-Year update to the Hazard Potential Classification Assessment for the FGD Ponds in accordance with the requirements of § 257.73(a)(2). The HPCA was performed using the methodology presented in Federal Guidelines for Dam Safety: Hazard Potential Classification System for Dams developed by the Federal Emergency Management Agency.

Based on the FEMA hazard potential criteria, the FGD Ponds are classified as **LOW** hazard potential CCR surface impoundments, since a failure or misoperation of the ponds results in no probable loss of human life, low economic and/or environmental losses, and no significant disruption of lifeline systems.

In accordance with § 257.73(f), this updated hazard potential classification assessment must be placed in the operating record for the OGSES no later than October 12, 2021. Subsequent periodic hazard potential classification assessments must be completed every five years.

# 1.0 INTRODUCTION

Oak Grove Management Company LLC (Oak Grove) owns and operates the Oak Grove Steam Electric Station (OGSES) located approximately ten miles north of Franklin in Robertson County, Texas. The power plant and related support areas are located along the south side of Twin Oak Reservoir (Figure 1). The OGSES consists of two lignite-fired units with a combined operating capacity of approximately 1,796 megawatts. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operation. The CCRs are transported off-site for beneficial use by third-parties or are disposed at the OGSES Ash Landfill 1.

The U.S. Environmental Protection Agency promulgated 40 C.F.R. Part 257, Subpart D (the CCR Rule) and the Texas Commission on Environmental Quality (TCEQ) promulgated 30 T.A.C. Chapter 352 (which largely adopts the federal CCR Rule by reference) to establish technical requirements for new and existing CCR landfills and surface impoundments. On June 28, 2021, USEPA approved the majority of TCEQ's CCR program, which will now operate in lieu of the federal regulations. FGD-A, FGD-B, and FGD-C (collectively the "FGD Ponds") at the OGSES have been identified as Existing CCR Surface Impoundments regulated under the CCR Rule.

Section 257.82 specifies that an Inflow Design Flood Control System Plan (IDFCSP) be designed, constructed, operated, and maintained for each existing CCR surface impoundment and 30 T.A.C. 352.821 adopts this requirement by reference. In accordance with § 257.82(c)(3), the initial IDFCSP for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016a). As specified in §257.82(c)(4), the IDFCSP must be updated every five years from the completion date of the initial plan. Golder Associates Inc., a member of WSP (Golder), was retained by Oak Grove to prepare this updated IDFCSP for the FGD Ponds.

## 1.1 CCR Surface Impoundment Inflow Design Flood Control System Plan Requirements

Section 257.82(a) specifies that an IDFCSP be designed, constructed, operated, and maintained for each existing CCR surface impoundment. The flood control system must adequately:

- Manage flow into the CCR impoundment during and following the peak discharge of the specified inflow design flood.
- Manage flow from the CCR impoundment to collect and control the peak discharge resulting from the specified inflow design flood.

The inflow design flood (IDF) for each CCR impoundment varies based on the hazard potential classification of the impoundment:

- High hazard potential impoundment: Probable Maximum Flood
- Significant hazard potential impoundment: 1,000-year flood
- Low hazard potential impoundment: 100-year flood

The IDFCSP must document how the inflow design flood control system has been designed and constructed to comply with the requirements of § 257.82 and must be certified by a qualified professional engineer.

## 1.2 OGSES Surface Impoundments Subject to Inflow Design Flood Control System Plan Requirements

Section 257.53 defines CCR's such as fly ash, bottom ash, boiler slag, flue gas desulfurization (FGD) materials (gypsum), and related solids generated from burning coal for the purpose of generating electricity by electric utilities and independent power producers. The IDFCSP requirements of the CCR Rule apply to surface impoundments that dispose or otherwise engage in solid waste management of CCRs.

The FGD Ponds have been identified as CCR Units subject to the IDFCSP requirements at the OGSES.

## 1.3 Description of FGD Ponds

The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (Figure 2) and are constructed above grade and surrounded by engineered earthen dikes that extend up to approximately 25 feet above surrounding grade.

Figure 3 shows a simplified process flow schematic for the FGD Ponds. The FGD Ponds receive wastewater from the FGD wet scrubber system blowdown, low volume wastewater, bottom ash contact water, and storm water runoff from approximately 41 acres of the power plant. All fluids are pumped into the FGD Ponds and there are no uncontrolled or gravity inflows into the ponds, with the exception of a gravity overflow from FGD-A to FGD-B. Process wastewater can be transferred between the FGD Ponds and is used as makeup water to the FGD scrubber system and related purposes. The are no spillways or other uncontrolled gravity flow releases from the ponds. Solids that accumulate in the FGD ponds are periodically removed and transported to OGSES Ash Landfill 1.

FGD-A covers an area of approximately 9 acres and was constructed in 2008. FGD-A is currently lined with a 3-foot thick compacted clay liner; however, FGD-A ceased receipt of waste by April 11, 2021, and Oak Grove has initiated the retrofit of FGD-A with a composite liner system meeting the requirements of § 257.71(a)(1)(ii). The retrofitted liner system will consist of a minimum 2-foot thick compacted clay liner or geosynthetic clay liner (GCL), overlain be a 60-mil HDPE geomembrane liner. The floor of the pond will be covered by a 1.5-foot thick layer of protective soil and the upper portion of the pond side slopes will be covered with concrete revetment mat.

FGD-B covers an area of approximately 11.2 acres and was constructed in 2011. FGD-B is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain be a 60-mil HDPE geomembrane liner, overlain by a 1-foot thick layer of protective soil. The composite liner system in FGD-B complies with the requirements of § 257.71(a)(1)(ii).

FGD-C covers an area of approximately 15.2 acres and was constructed in 2016. FGD-C is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner, overlain by a 2-foot thick soil/ash protective layer. The composite liner system in FGD-C complies with the requirements of § 257.71(a)(1)(ii).

Based on available construction data, the FGD Ponds were constructed to provide the following estimated storage capacities (with zero freeboard):

- FGD-A: 190 acre-feet,
- FGD-B: 125 acre-feet, and
- FGD-C: 248 acre-feet.

Area-Capacity Curves for the FGD Ponds are reproduced in Appendix B (Golder, 2016b).

## 1.4 USACE Size Classification for FGD Ponds

The US Army Corps of Engineers (USACE) classifies the relative size of dams based on the height of the dam and the storage capacity of the impounded area behind the dam as follows (USACE, 1979):

| USACE Dam Size Classification | | |
|---|---|---|
| **Size Category** | **Impoundment Capacity (acre-ft)** | **Impoundment Height (ft)** |
| Small | 50 and < 1,000 | 25 and < 40 |
| Intermediate | 1,000 and < 50,000 | 40 and < 100 |
| Large | > 50,000 | > 100 |

Based on the dike heights and operating capacities of the FGD Ponds, these ponds are categorized as small impoundments based on the USACE dam size classification criteria.

## 1.5 Hazard Potential Classification of FGD Ponds

The FGD Ponds are classified as low hazard potential impoundments in accordance with the requirements of § 257.73(a)(2) (Golder, 2021).

## 1.6 Previous Hydraulic Capacity Evaluations of FGD Ponds

The FGD Ponds were previously subjected to the following Hydraulic Capacity Evaluations:

- **Initial Inflow Design Flood Control System Plan, 2016**. As required under § 257.82(c)(3), the initial Inflow Design Flood Control System Plan for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016a). The initial IDFCSP concluded that the FGD Ponds were adequately designed to manage the 100-year, 24-hour inflow design flood in accordance with § 257.82.
- **EPA Hydraulic Capacity Evaluation, 2014**. In 2009, the EPA initiated a program to assess the stability and functionality of coal ash impoundments at coal-fired electric generating plants across the United States. The assessment of the stability and functionality of FGD-A and FGD-B was performed by O'Brien and Gere (OBG) on behalf of EPA (OBG, 2014). As part of the assessment, OBG evaluated the "Hydrologic/Hydraulic Safety" of FGD-A and FGD-B and concluded the following:
  - FGD-A and FGD-B only receive water pumped into the units at a controlled rate, with the exception of a gravity overflow from FGD-A to FGD-B.
  - The normal pool elevation of FGD-A and FGD-B is managed to provide a minimum of 2-foot freeboard.
  - OBG examined the 100-year rainfall event and compared the data with the available freeboard in the ponds. The freeboard should be adequate to contain the one-percent probability, 24- hour precipitation event without overtopping the impoundment embankments.

Based on the information reviewed, FGD-A and FGD-B were given the highest rating of "Satisfactory" for hydrologic and hydraulic safety.

# 2.0 UPDATED HYDRAULIC CAPACITY EVALUATION OF FGD PONDS

Section 257.73 defines the inflow design flood (IDF) as “the flood hydrograph that is used in the design or modification of the CCR surface impoundment and its appurtenant works.” From an engineering design standpoint, the IDF is the rate of water coming into a surface impoundment over time that the impoundment must be able to safely pass or contain using a combination of outlet works and surcharge storage (freeboard).

The updated IDFCSP for the FGD Ponds must demonstrate that the impoundments are designed to manage flow into and out of the units during and following the peak discharge of the specified inflow design flood. This demonstration will be accomplished through calculation of a water balance for the FGD Ponds. The basic equation for the water balance is as follows:

Inflows = Outflows + Change in Pond Storage

For the water balance to demonstrate compliance with CCR requirements, the rate of inflows into the FGD Ponds (the inflow design flood) must not be greater than the rate of outflows from the FGD Ponds plus the maximum allowable storage in the impoundments.

## 2.1 Inflows to FGD Ponds

The FGD Ponds are located above grade and inflows that enter the impoundments are pumped into the units under controlled conditions – there are no gravity or uncontrolled discharges to the FG Ponds, other than a gravity overflow from FGD-A to FGD-B. As shown on Figure 3, water coming into the FGD Ponds consists of the following:

- wastewater from the FGD wet scrubber system blowdown,
- low volume wastewater,
- bottom ash contact water,
- storm water runoff from approximately 41 acres of the power plant, and
- direct precipitation on the ponds.

Most of the sources of inflow to the FGD Ponds are process units that generate water at controlled rates which are not significantly affected by variations in precipitation intensity and associated flood conditions. In addition, approximately the same flow rate and volume of water is pumped from the FGD Ponds to the plant FGD wet scrubber system as is returned to the FGD Ponds form the plant. As a result, for the purposes of this IDFCSP, it is assumed that the only net contributions from inflows to the FGD Ponds during the design flood event are:

- storm water runoff from approximately 41 acres of the power plant, and
- direct precipitation on the ponds.

## 2.2 Outflows From FGD Ponds

The FGD Ponds act as surge basins for various water streams in the plant water system and process wastewater can be transferred to and from FGD-A, FGD-B and/or FGD-C. The rate of outflow from the FGD Ponds is controlled to maintain a minimum 2-foot freeboard in FGD-A and FGD-B and 3-foot freeboard in FGD-C under normal operating conditions.

The are no spillways or other uncontrolled gravity flow releases from the ponds, with the exception of a gravity overflow form FGD-A to FGD-B. It should be noted that water is also removed from the FGD Ponds through natural evaporation; however, evaporation from the FGD Ponds was not considered as part of this evaluation.

## 2.3 Inflow Design Flood for FGD Ponds

As described in Section 1.5, the FGD Ponds are classified as a low hazard potential CCR Impoundments. In accordance with § 257.82(a)(3), the inflow design flood for a low hazard potential CCR impoundment is the 100-year flood event.

The 100-year, 24-hour storm for the FGD Ponds is estimated to be 10.4 inches based on the Point Precipitation Frequency Estimate Table from the National Oceanic and Atmospheric Administration (NOAA) Atlas 14 for Franklin, TX (NOAA, 2021, see Appendix A).

## 2.4 Hydraulic Capacity Evaluation for FGD Ponds

A hydraulic capacity evaluation was performed on the FGD Ponds for the inflow design flood as part of the development of the IDFCSP. The evaluation was based on the water balance equation described above and the following assumptions:

- The design operating level in the ponds is managed to maintain a minimum 2-foot freeboard in FGD-A and FGD-B and 3-foot freeboard in FGD-C under normal operating conditions.
- Inflows to and outflows from the FGD Ponds considered as part of the evaluation are as described in Sections 2.1 and 2.2 of this report.
- Evaporation from the ponds is assumed to be negligible during the inflow design flood event.

Based on these assumptions, the general water balance equation for the FGD Ponds can be modified as follows:

Process Inflows + Direct Precipitation = Process Outflows + Change in FGD Pond Storage

Since the rate of water decanted from the FGD Ponds (process outflow) is assumed to be equivalent to the process water inflows to the ponds, the FGD Pond water balance equation becomes:

Direct Precipitation + Runoff From Power Plant = Change in FGD Pond Storage

Stormwater runoff volumes were calculated using the Rational Method:

V = CiA, where:

V = Estimated Runoff Volume (cubic feet, cf)

C = Rational Method Runoff Coefficient. Assumed Runoff Coefficients:

- Direct Precipitation on Pond Surface: 1.00
- Runoff From Power Plant: 0.95

i = Rainfall (ft). Assumed to be 10.4 inches (0.87 feet) for the 100-year, 24-hr design flood.

A = Stormwater Drainage Area (sf)

Hydraulic capacity evaluation calculations for the FGD Ponds are presented in Appendix C. Inflows into the ponds during the design flood were estimated to be as follows:

- Direct Precipitation On Ponds. The surface areas of the FGD Ponds at the top of the perimeter dikes are approximately as follows:

  - FGD-A: 9 acres (391,789 sf)
  - FGD-B: 11.2 acres (486,669 sf)
  - FGD-C: 15.2 acres (662, 896 sf)

  A Runoff Coefficient of 1.0 was assumed for direct precipitation on the ponds. Based on these assumptions, the volume of direct precipitation onto the FGD Ponds is estimated to be as follows:

  - FGD-A: 339,768 cf
  - FGD-B: 422,822 cf
  - FGD-C: 573,830 cf

- Runoff From Power Plant. For the purposes of this IDFCSP, it is assumed that all stormwater runoff/drainage from the power plant area is pumped to the FGD Ponds during the design flood. The surface area of the plant area is estimated to be approximately 41 acres (1,785,960 sf) (Golder, 2016a). The plant area is primarily concrete, so a Runoff Coefficient of 0.95 was assumed for this area. Based on these assumptions, the volume of runoff from the Power Plant is estimated to be 1,470,440 cf.

The total inflow into the FGD Ponds during the design flood is estimated to be 2,806,861 cf (64.4 acre-ft).

Based on the Area-Capacity Curves in Appendix B, the available storage capacity provided by the 2-foot freeboard in FGD-A and FGD-B and 3-foot freeboard in FGD-C is estimated to be as follows:

- FGD-A:
  - Capacity at top of dike: 190 acre-ft
  - Capacity at 2 feet below top of dike: 172 acre-ft
  - Available Freeboard Storage: 18 acre-ft
- FGD-B:
  - Capacity at top of dike: 125 acre-ft
  - Capacity at 2 feet below top of dike: 104 acre-ft
  - Available Freeboard Storage: 21 acre-ft
- FGD-C:
  - Capacity at top of dike: 248 acre-ft
  - Capacity at 3 feet below top of dike: 204 acre-ft
  - Available Freeboard Storage: 44 acre-ft

The total available freeboard storage in the FGD Ponds is approximately 83 acre-ft (3,615,480 cf).

The available freeboard storage compares to the total inflow into the FGD Ponds during the design flood as follows:

- Available Freeboard Storage: 3,615,480 cf (83 acre-ft)
- Total Inflow into FGD Ponds: 2,806,861 cf (64.4 acre-ft)
  - Remaining Freeboard Storage: 808,619 cf (18.6 acre-ft)

As a result, the FGD Ponds are adequately designed to manage the inflow design flood in accordance with § 257.82.

# 3.0 UPDATED INFLOW DESIGN FLOOD CONTROL SYSTEM PLAN FOR FGD PONDS

The FGD Ponds are adequately designed to manage the 100-year, 24-hour inflow design flood in accordance with § 257.82. The FGD Ponds should be operated in accordance with the following Inflow Design Flood Control System Plan to maintain adequate freeboard in the impoundment to manage the design flood conditions:

- The operating level in FGD-A and FGD-B should be maintained to provide a minimum of 2 feet of freeboard in the impoundments under normal operating conditions.
- The operating level in FGD-C should be maintained to provide a minimum of 3 feet of freeboard in the impoundment under normal operating conditions.
- Stormwater managed by OGSES sumps should be allowed to accumulate to the extent practicable and the transfer of stormwater collected by the plant sumps should be monitored and regulated to ensure adequate freeboard is maintained in the FGD Ponds during a storm event.

In accordance with § 257.82(c)(4), this updated IDFCSP must be placed in the operating record for the OGSES no later than October 12, 2021. Subsequent periodic IDFCSPs must be completed every five years. In addition, the IDFCSP must be amended whenever there is a change in conditions that would substantially affect the plan.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

**APPENDIX C**

# Hydraulic Capacity Evaluation Calculations - FGD Ponds

**Appendix C**
**Oak Grove Steam Electric Station**
**Inflow Design Flood Control System Plan**
**Inflow Volume Estimates**
**FGD Ponds**

**Assumptions**

1) Design Rainfall (in): 10.4 100-Year, 24-Hr Storm

2) Inflows to FGD Ponds Consist of the Following:

- Direct Precipitation on the FGD Ponds
- Runoff Pumped From Power Plant

3) Runoff Volumes Calculated Using the Rational Method:

V = CiA, where:

V = Estimated Runoff Volume (cf)
C = Rational Method Runoff Coefficient
i = Rainfall (ft)
A = Stormwater Drainage Area (sf)

4) Assumed Runoff Coefficients:

| | |
|---|---|
| - Direct Precipitation on Lined Pond Surface: | 1.00 |
| - Power Plant Drainage: | 0.95 |

5) Drainage Areas (acres):

| | |
|---|---|
| - FGD-A: | 9.0 |
| - FGD-B: | 11.2 |
| - FGD-C: | 15.2 |
| - Power Plant Drainage: | 41 |

6) Assume Total Inflow Volume Generated During 100-Yr, 24-Hr Storm must be Contained in Freeboard of FGD Ponds

**Inflow Volume Estimates**

| | |
|---|---|
| 1) Precip on FGD-A (cf): | 339,768 |
| 2) Precip on FGD-B (cf): | 422,822 |
| 3) Precip on FGD-C (cf): | 573,830 |
| 4) Power Plant Runoff Pumped to FGD Ponds (cf): | 1,470,440 |
| **Total Inflow Volume to FGD Ponds (cf):** | **2,806,861** |

**Notes:**
1) 100 Yr, 24-Hr Storm from NOAA Atlas 14 for Franklin, TX.

**RE: HISTORY OF CONSTRUCTION**
**CCR SURFACE IMPOUNDMENTS, OAK GROVE SES**
**ROBERTSON COUNTY, TX**

## 1.0 INTRODUCTION

The "Disposal of Coal Combustion Residuals (CCR) from Electric Utilities rule" (40 Code of Federal Regulations (40 CFR) Part 257), effective October 19, 2015, requires that existing CCR units meeting the requirements of §257.73(b) compile a history of construction, containing all the items, to the extent feasible, listed in §257.73(c)(1)(i) – (xii). This letter provides a history of construction pursuant to §257.73(c) for the Oak Grove Steam Electric Station's (OGSES) CCR Impoundments, identified as flue gas desulphurization (FGD) Ponds FGD-A, FGD-B, and FGD-C.

## 2.0 OWNER AND OPERATOR - §257.73(c)(1)(i)

OGSES is currently owned and operated by Oak Grove Management Company LLC. The three FGD Ponds referenced in this letter have been assigned the following TCEQ WMU numbers.

- FGD-A 011
- FGD-B 012
- FGD-C 013

## 3.0 HISTORY OF CONSTRUCTION

OGSES is a lignite-fueled (i.e. coal-fired) power plant that commenced final construction activities in 2007. Golder Associates Inc. (Golder) has provided engineering services supporting construction of the Oak Grove CCR units since 2008.

## 3.1 Location - §257.73(c)(1)(ii)

OGSES is located in Robertson County, Texas, approximately 10 miles north of the City of Franklin. Figure 1 provides the location of the Power Plant with the FGD Ponds identified on the most recent U.S. Geological Survey (USGS) topographic map. Figure 2 provides an aerial map view of the power plant and its ancillary facilities.

LUMINANT

**Golder Associates Inc.**
500 Century Plaza Drive, Suite 190
Houston, TX 77073 USA
Tel: (281) 821-6868 Fax: (281) 821-6870 www.golder.com

Golder Associates: Operations in Africa, Asia, Australasia, Europe, North America and South America

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation

## 3.2 Purpose - §257.73(c)(1)(iii)

The OGSES power plant produces coal combustion residuals (CCR's) in the form of fly ash, bottom ash and flue gas desulphurization (FGD) byproduct (gypsum). The CCR Surface Impoundments at OG that are covered by the CCR Rule (FGD- A, FGD- B and FGD-C) handle primarily the FGD gypsum. Fly ash and bottom ash are processed and transported by dry methods to Ash Landfill 1.

## 3.3 Watershed - §257.73(c)(1)(iv)

The embankments of all three ponds are raised above the surrounding ground surface; therefore, the surface impoundments are not affected by any adjacent watershed. However, in the event of a failure of the northern embankment in FGD-A, the contents of FGD-A could flow into FGD-B.

## 3.4 Foundation Materials - §257.73(c)(1)(v)

Preparation of FGD-A and FGD-B Pond's foundation occurred during the initial phase of construction in the 1980s. Golder conducted a subsurface investigation for FGD-A in 2008 and evaluated the existing liner in FGD-B in 2011. Based on a review of the available information and the subsurface investigations, the foundation soils at FGD-A and FGD-B Ponds consist of very stiff to hard clays and compact to very dense sands.

Continuous construction of FGD-C began on July, 12, 2015. Based on a subsurface investigation conducted by Golder in 2014, the foundation soils consist of a combination of fill and native clays and sands. Accurate identification of existing fill materials during drilling activities was not always possible, due to similarity with natural soils, not only in type but in relative consistency. In general, both the fill and native material consists of stiff to hard clays and compact to very dense sands.

## 3.5 Construction - §257.73(c)(1)(vi)

### *3.5.1 Construction Materials and Site Preparation*

The following sections provide details on the materials and site preparation methods employed during construction of each of the surface impoundments. Construction dates are provided in section 3.5.2 and specific construction documentation references are provided in section 3.10 of this letter.

#### 3.5.1.1 FGD-A Pond

The FGD-A Pond embankment was constructed of compacted site soils. No construction testing of the original embankment fill is available.

A compacted clay liner was installed within FGD-A in 2008. The clay was obtained from an on-site borrow source and compacted in 6-inch lifts to ≥ 95% of the maximum standard Proctor dry density and within +2% to +6% of the standard Proctor optimum water content. Based on testing of Shelby tube samples collected during clay liner construction, the 3-foot thick compacted clay liner has a hydraulic conductivity less than $1 \times 10^{-7}$ cm/s.

#### 3.5.1.2 FGD-B Pond

The original FGD-B Pond embankment was constructed of compacted site soils. No construction testing of the original embankment fill is available.

In 2011, the base and embankment crest elevation of FGD-B Pond were raised and the pond was lined with a composite geomembrane/clay liner system. The subgrade was raised using structural fill to increase the separation depth from the groundwater. Approximately 150,000 cy of structural fill was placed in 6-inch lifts and compacted to ≥ 95% of the maximum standard Proctor dry density and within -3% to +3% of the standard Proctor optimum water content. Following subgrade preparation, a 2-ft thick clay liner was placed and compacted in 6-inch thick lifts to 95% of the maximum standard Proctor dry density and within +2% to

LUMINANT

+6% of the standard Proctor optimum water content. Based on testing of Shelby tube samples collected during clay liner construction, the compacted clay liner has a hydraulic conductivity less than 1 x $10^{-7}$ cm/s. A 60-mil HDPE geomembrane was placed over the clay liner and subsequently covered with a 1-ft thick soil cover.

In 2015, repairs were made to the protective cover along the inside crest of the embankment.

#### 3.5.1.3 FGD-C Pond

Following removal of loose/soft and/or organic material, the FGD-C embankment was constructed of compacted site soils placed in 6-inch lifts compacted to ≥ 95% of the standard Proctor maximum dry density and within -3% to +3% of the standard Proctor optimum water content.

FGD-C Pond is lined with a composite liner consisting of a 2-ft thick clay liner, a 60-mil HDPE geomembrane and a 2-ft thick soil/ash protective cover. The clay liner was placed and compacted in 6-inch thick lifts to ≥ 95% of the maximum standard Proctor dry density and within +2% to +6% of the standard Proctor optimum water content. Based on testing of Shelby tube samples collected during clay liner construction, the compacted clay liner has a hydraulic conductivity less than 1 x $10^{-7}$ cm/s.

### *3.5.2 Construction Dates*

The following is a list of the Oak Grove FGD-A, FGD-B, and FGD-C Ponds' construction dates.

- Circa 1980: Site grading, structural fill placement, and soil liner placement at FGD-A and FGD-B Ponds.
- August 28, 2008 - October 18, 2008: Construction of the FGD-A Pond clay liner system.
- July 7, 2011 – July 25, 2011: Site grading and structural fill placement for FGD-B Pond.
- October 7, 2011 - November 9, 2011: Construction of the FGD-B Pond composite liner system.
- July 12, 2015 – August 20, 2015: Site grading and structural fill placement for FGD-C Pond.
- August 21, 2015 – February 10, 2016: Construction of the FGD-C Pond composite liner system.
- April 1, 2016 – June 24, 2016: Placement of the ash protective cover layer.

## 3.6 Drawings - §257.73(c)(1)(vii)

Attachment 1 provides the design drawings from the FGD-A, FGD-B, and FGD-C Pond Registration Packages as well as the as-built drawings submitted within each impoundment's Liner Evaluation Report.

In each pond the normal operating pool surface and maximum depth of CCR elevation is 2 feet below the crest elevation and the maximum pool surface is equal to the embankment crest elevation. The depths of CCR are 25.5 feet in FGD-A; 13.5 feet in FGD-B; and 19.0 feet in FGD-C.

## 3.7 Instrumentation - §257.73(c)(1)(viii)

With the exception of pool elevation gauges, there is no instrumentation on any of the surface impoundments.

## 3.8 Area-Capacity Curves - §257.73(c)(1)(ix)

Using as-built survey information, area capacity curves have been developed or each FGD pond. The capacity curves calculation is included as Attachment 2.

## 3.9 Spillways and Diversion Features - §257.73(c)(1)(x)

There are no spillways on any of the surface impoundments.

## 3.10 Construction Specifications and Surveillance - §257.73(c)(1)(xi)

The following tables list documents that contain the design, figures, specifications, construction and quality assurance reports for the FGD Ponds.

Each surface impoundment is inspected weekly by Luminant personnel and annually by a licensed professional engineer in accordance with §257.83. Items requiring maintenance and repair are identified during the inspections and subsequently repaired.

## 3.11 Structural Instability - §257.73(c)(1)(xii)

There is no knowledge of structural instability within any of the surface impoundments.

## 4.0 CLOSING

Golder Associates was retained by Luminant to prepare a history of construction for the CCR units at the Oak Grove SES. Based on our review of the available information, to the extent feasible, this letter provides information required by 40 CFR §257.73(c)(i) through (xii), related to construction of FGD-A, FGD-B, and FGD-C Ponds.

Sincerely,

**GOLDER ASSOCIATES INC.**

## LEGEND

- LIMIT OF 1987 REGISTERED LANDFILL AREA
- PROPERTY BOUNDARY
- EXISTING GROUND TOPOGRAPHY
- CURRENT POND CONSTRUCTION AREA

## NOTES

1. SITE LOCATION: ROBERTSON COUNTY, TEXAS.

## REFERENCES

1. EXISTING GROUND TOPOGRAPHY IN THE VICINITY OF THE ASH LANDFILL IS FROM AN AERIAL SURVEY PERFORMED BY GEODETIX, INC., ON MAY 27, 2010. EXISTING GROUND TOPOGRAPHY ELSEWHERE IS FROM FLUOR ENTERPRISES, INC., DRAWING A2YF00-0-CV-0-SW.PL.-01, AS PROVIDED BY LUMINANT.
2. COORDINATES ARE BASED ON OAK GROVE STEAM ELECTRIC STATION PLANT GRID SYSTEM.
3. ELEVATIONS ARE BASED ON MEAN SEA LEVEL DATUM.
4. CLAY MATERIAL AND STRUCTURAL FILL STOCKPILE AREAS NEED TO BE CLEARED AND GRUBBED PRIOR TO STOCKPILING ACTIVITIES.

## NOTES

1. REFER TO BURNS & McDONNELL LUMINANT PROJECT 4159K004 "REFURBISH FGD-B POND" CONTRACT DRAWINGS.
2. COMPACTED CRUSHED STONE ROAD BASE
3. USE FABRICATED PIPE FITTINGS WHERE 30' (MIN.) BEND RADIUS IS EXCEEDED.
4. PROTECTIVE COVER WILL CONSIST OF ONSITE SOILS (COMPACT TO 95% MDD BENEATH ACCESS ROAD AND STILLING BASIN.)

**NOTES**

1. EXISTING GROUND TOPOGRAPHY IN THE VICINITY OF THE POND IS TAKEN FROM A GROUND SURVEY PERFORMED BY SAM, INC. ON OCTOBER 23, 2014 AND FEBRUARY 4, 2015.
2. PROPOSED CONTOURS SHOWN ARE TOP OF SUBGRADE AND CONTAINMENT DIKE.
3. EXCAVATED SOILS TO BE SEGREGATED AND STOCKPILED AT A LOCATION DESIGNATED BY OWNER.
4. COMPACTED FILL SHALL BE PLACED ON STABLE SUBGRADE FREE OF LOOSE OR ORGANIC MATERIAL. COMPACTED FILL SHALL BE PLACED AND TESTED IN ACCORDANCE WITH THE PROJECT SPECIFICATIONS. UNSTABLE SOILS SHALL BE OVEREXCAVATED AND REPLACED WITH COMPACTED FILL AS DEEMED APPROPRIATE BY THE OWNER OR ENGINEER.
5. CONTROL POINTS SHOWN ARE ON THE LOCAL COORDINATE PLANT GRID SYSTEM.

**NOTES**

1. EXISTING GROUND TOPOGRAPHY IN THE VICINITY OF THE POND TAKEN FROM A GROUND SURVEY PERFORMED BY SAM, INC. ON OCTOBER 23, 2014 AND FEBRUARY 4, 2015.
2. PROPOSED CONTOURS SHOWN ARE TOP OF CLAY LINER.
3. A MINIMUM OF 2 ft OF COMPACTED CLAY LINER SHALL BE PLACED AND TESTED IN ACCORDANCE WITH THE PROJECT SPECIFICATIONS.
4. CONTROL POINTS SHOWN ARE ON THE LOCAL COORDINATE PLANT GRID SYSTEM.

# PROFESSIONAL CERTIFICATION

This document and all attachments were prepared by WSP Golder under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I hereby certify that Addendum No.1 to the History of Construction Report for the FGD Ponds at the Oak Grove Steam Electric Station has been prepared in accordance with the requirements of 40 C.F.R. §257.73(c).

# 1.0 INTRODUCTION

On behalf of Oak Grove Management Company LLC (Luminant), WSP Golder (Golder) has prepared this Addendum No. 1 to the History of Construction Report (HCR) for FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") located at the Oak Grove Steam Electric Station (OGSES) in Robertson County, Texas (hereafter, the "Site"). The FGD Ponds are regulated as Existing CCR Impoundments under 40 C.F.R. § 257, Subpart D (the "CCR Rule").

The original HCR for the Site was prepared in October 2016 in accordance with 40 C.F.R. §257.73(c) and placed in the OGSES operating record in accordance with 40 C.F.R. §257.105(h)(10) (Golder, 2016a). This Addendum No. 1 updates the HCR to reflect the following:

- Documentation of the watershed areas for the FGD Ponds in accordance with 40 C.F.R. § 257.73(c)(1)(iv); and
- Retrofit of the FGD-A liner system to comply with the requirements of 40 C.F.R. § 257.71(a)(1)(ii) completed in accordance 40 C.F.R. § 257.102(k).

## 2.0 FGD POND WATERSHED AREAS

The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (see Figure 1). The impoundments are constructed above grade and are surrounded by engineered earthen dikes that extend to approximately 25 feet above surrounding ground level. The approximate surface area of each FGD Pond is as follows:

- FGD-A covers an area of approximately 9.4 acres;
- FGD-B covers an area of approximately 11.3 acres; and
- FGD-C covers an area of approximately 17 acres.

Figure 2 shows a simplified process flow schematic for the FGD Ponds. The FGD Ponds act as surge basins for the following water streams associated with the OGSES plant water system:

- wastewater from the FGD wet scrubber system blowdown,
- low volume wastewater,
- bottom ash contact water,
- storm water runoff from approximately 41 acres of the power plant, and
- direct precipitation on the ponds.

Water is pumped into either FGD-A or FGD-C under controlled conditions and a gravity overflow is used to transfer water from FGD-A to FGD-B. Water is pumped out of FGD-A, FGD-B and/or FGD-C and recycled as makeup water for the plant FGD scrubber system and related purposes. The are no spillways or other uncontrolled gravity flow releases from the FGD Ponds.

40 C.F.R. § 257.73(c)(1)(iv) requires that the watershed for each CCR unit be documented in the HCR. As described above, the FGD Ponds are constructed above grade; consequently, the “watershed” for each pond consists of direct precipitation on the pond surface itself. The watershed area of each FGD Pond is therefore as follows:

| Impoundment | Watershed Area |
|---|---|
| FGD-A | Approximately 9.4 acres |
| FGD-B | Approximately 11.3 acres |
| FGD-C | Approximately 17 acres |

# 3.0 RETROFIT OF FGD-A LINER SYSTEM

FGD-A was originally constructed with a 3-foot thick compacted clay liner exhibiting a hydraulic conductivity of no more than 1 x$10^{-7}$ cm/sec (Golder 2016b). FGD-A was formerly considered a lined CCR surface impoundment in accordance with 40 C.F.R. §257.71(a)(1)(i) of the CCR Rule; however, the impoundment was reclassified as an unlined impoundment based on the August 2018 DC Circuit Court Ruling. Luminant decided to retrofit the FGD-A liner system to satisfy the requirements of 40 C.F.R. §257.71(a)(1)(ii) and maintain compliance with the CCR Rule.

From September 2021 to July 2022, the liner system in FGD-A was retrofitted in accordance with 40 C.F.R. § 257.102(k). Liner Retrofit Plans for FGD-A were prepared in March 2020 and July 2021 in accordance with § 40 C.F.R. 257.102(k)(2) and placed in the OGSES operating record in accordance with 40 C.F.R. §257.105(h)(10) (Golder, 2020; Golder, 2021).

The FGD-A retrofit measures consisted of the following.

- Pumping of free water from FGD-A to FGD-B and FGD-C;
- Excavation of all CCR from FGD-A and placement in OGSES Ash Landfill 1;
- Excavation of approximately the upper 1 foot of the existing 3-foot thick clay liner and placement in OGSES Ash Landfill 1;
- Construction of a composite liner system meeting the requirements of 40 C.F.R. § 257.71(a)(1)(ii); and
- Incorporation of design improvements to facilitate sediment control and access for future CCR removal associated with operations.

The retrofitted liner system in FGD-A consists of the following (from bottom to top):

- Minimum 2-foot thick layer of compacted clay exhibiting a hydraulic conductivity of no more than 1 x$10^{-7}$ cm/sec (previous clay liner remaining after pond excavation);
- A geosynthetic clay liner (GCL) placed in areas of the pond where a minimum of 2-feet of compacted clay was not remaining after pond excavation was completed;
- A 60-mil HDPE geomembrane liner;
- A 1.5-foot thick layer of protective soil; and
- A concrete revetment mat placed over the upper portion of the pond side slopes.

Engineering drawings for the FGD-A Liner Retrofit and as-built survey drawings are reproduced in Appendix A and Appendix B of this Addendum.

The retrofitted liner system in FGD-A is an alternative composite liner meeting the requirements of 40 C.F.R. § 257.71(a)(1)(ii).

## GENERAL NOTES

1. ALL LUMINANT AND APPLICABLE OSHA HEALTH AND SAFETY REQUIREMENTS SHALL BE FOLLOWED DURING EXECUTION OF THE WORK. LUMINANT PROCEDURES SHALL BE USED FOR ALL EXCAVATIONS, HOT WORK, AND LOCK-OUT/TAG-OUT.
2. FOR THIS WORK, LUMINANT IS THE OWNER AND GOLDER ASSOCIATES INC. IS THE ENGINEER. THE COMPANY BIDDING THE WORK IS THE CONTRACTOR.
3. CONTRACTOR IS RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING UNDERGROUND, ABOVE-GRADE, AND OVERHEAD UTILITIES. ALL EXISTING UNDERGROUND UTILITIES SHOULD BE FIELD VERIFIED AND LOCATED BY POTHOLING PER LUMINANT REQUIREMENTS.
4. WORKERS SHALL BE AWARE OF ACTIVE EQUIPMENT IN THE VICINITY OF THE WORK AREA AND SHALL TAKE PRECAUTIONS NOT TO DISTURB OPERATING EQUIPMENT.
5. CONTRACTOR SHALL VERIFY ALL DIMENSIONS, ELEVATIONS, AND SITE CONDITIONS PRIOR TO STARTING WORK, AND SHALL NOTIFY THE OWNER'S REPRESENTATIVE IF CONFLICTS EXIST ON THE DRAWINGS.
6. LOCATIONS AND DIMENSIONS OF EXISTING UTILITIES AND STRUCTURES ARE BASED ON DRAWINGS AND PARTIAL GROUND SURVEY PROVIDED BY LUMINANT AND SHOULD BE FIELD-VERIFIED.
7. CONTRACTOR SHALL PERFORM HOUSEKEEPING DUTIES ON A DAILY BASIS TO KEEP WORK AREAS CLEAN. HOUSEKEEPING SHALL BE PERFORMED AT THE COMPLETION OF THE WORK TO THE SATISFACTION OF THE OWNER.
8. CONTRACTOR SHALL STAGE EQUIPMENT AND MATERIALS ONLY IN AREAS APPROVED BY THE OWNER.
9. CONTRACTOR IS RESPONSIBLE FOR SURVEY CONTROL.
10. SPECIAL TOOLS AND OTHER REQUIRED INSTALLATION EQUIPMENT SUCH AS SLINGS, LEVER TOOLS, RATCHET JACKS, PULLING CABLES, ETC., FOR MAKEUP OF JOINTS SHALL BE FURNISHED BY THE CONTRACTOR.
11. TEST PLUGS, HYDROTEST PUMPS, GAUGES, RELIEF VALVES, AND ALL TESTING EQUIPMENT SHALL BE FURNISHED BY THE CONTRACTOR.
12. PIPING CROSSING UNDER ROADWAYS IS DESIGNED FOR AASHTO HS-20 LOADINGS. ALL PIPES SHALL HAVE A MINIMUM COVER DEPTH OF 2'-0" AS MEASURED FROM THE TOP OF THE PIPE UNLESS OTHERWISE INDICATED ON THE DRAWINGS.
13. WHERE VERTICAL OR HORIZONTAL ALIGNMENT REQUIRES DEFLECTION FROM STRAIGHT LINE OR GRADE, SUCH DEFLECTION SHALL NOT EXCEED MAXIMUM DEFLECTION RECOMMEND BY THE PIPE MANUFACTURER. IF ALIGNMENT REQUIRES DEFLECTION EXCEEDING RECOMMENDED LIMITS, FURNISH SPECIAL BENDS TO PROVIDE ANGULAR DEFLECTIONS WITHIN THE ALLOWABLE LIMITS.
14. PIPE SHALL BE CUT NEATLY AND WITHOUT DAMAGE TO THE PIPE. UNLESS OTHERWISE RECOMMENDED BY THE PIPE MANUFACTURER, CUT PIPE WITH MECHANICAL CUTTER ONLY. CUT PLASTIC PIPE SQUARE, USING HAND SAW, AND REMOVE ALL BURRS.
15. APPROPRIATE PROVISIONS SHALL BE MADE TO PREVENT PIPE FLOTATION AND PREVENT FOREIGN MATERIAL FROM ENTERING PIPE OPENINGS. TEMPORARY BLINDS SHALL BE PLACED ON ALL PIPE ENDS AND STUB-UPS DURING INSTALLATION. BLINDS ARE NOT TO BE REMOVED UNTIL PERMANENT CONNECTIONS ARE MADE.
16. VALVE BODIES USED ON THE PROPOSED DRAIN LINES FROM FGD-A POND AND FGD-B POND SHALL BE SET ON A CONCRETE SUPPORT FOOTING AS APPROVED BY THE OWNER'S REPRESENTATIVE.
17. NEW WAFER KNIFE GATE VALVE WITHIN THE PUMP STRUCTURE WILL BE SUPPORTED BY EXISTING ADJACENT PIPING SUPPORTS.
18. IF DISTURBED DURING CONSTRUCTION, THE EXISTING GATE VALVE ON THE FGD-A TO FGD-B CROSSOVER PIPELINE SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL APPROVED BY THE OWNER'S REPRESENTATIVE AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE VALVE BODY. THE MATERIAL DIRECTLY ABOVE THE PIPE IN THE EMBEDMENT ZONE SHALL BE ONLY LIGHTLY COMPACTED TO AVOID DISTORTING THE PIPE.
19. CONFIGURATIONS AND DIMENSIONS SHOWN ARE BASED ON TYPICAL DIMENSIONS FOR FITTINGS AND VALVES. ACTUAL DIMENSIONS MAY VARY BY MANUFACTURER AND WILL REQUIRE FIELD ADJUSTMENTS.

## UNDERGROUND PIPE INSTALLATION

1. CONTRACTOR SHALL SUBMIT A TRENCHING SAFETY PLAN FOR REVIEW AND APPROVAL BY THE OWNER BEFORE ANY TRENCHING ACTIVITIES CAN BEGIN. THE PLAN SHALL INDICATE THE SYSTEMS, METHODS, AND TECHNIQUES TO BE USED TO ENSURE THAT ALL TRENCH SIDEWALLS WILL BE STABLE AND/OR GUARDED FOR THE PROTECTION OF PERSONNEL AND FACILITIES IN THE VICINITY OF THE WORK.
2. AS REQUIRED, CONTRACTOR SHALL PREPARE AND IMPLEMENT AN OWNER APPROVED PLAN TO CONTROL GROUNDWATER IN ALL DEVELOPED EXCAVATIONS (INCLUDING GROUNDWATER AND SURFACE WATER).
3. UNDERGROUND PIPE SHALL BE LOWERED INTO TRENCH BY MEANS OF DERRICK, ROPES, BELT SLINGS, OR OTHER EQUIPMENT RECOMMENDED BY THE PIPE SUPPLIER. TAKE SPECIAL CARE IN HANDLING PREFABRICATED SECTIONS OF HDPE PIPE - THE FUSED FITTINGS MAY NOT BE CAPABLE OF CARRYING THE WEIGHT OF ADJACENT PIPING. DO NOT DUMP OR DROP ANY MATERIALS INTO THE TRENCH.
4. FOR UNDERGROUND AND ON-GRADE HDPE PIPE, REST THE FULL LENGTH OF EACH SECTION OF THE PIPE SOLIDLY ON THE PIPE BED. DO NOT LAY PIPE IN WATER, OR WHEN FOUNDATION CONDITIONS ARE UNSUITABLE FOR THE WORK.
5. UNDERGROUND PIPING SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL APPROVED BY THE OWNER'S REPRESENTATIVE AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE MATERIAL DIRECTLY ABOVE THE PIPE IN THE EMBEDMENT ZONE SHALL BE ONLY LIGHTLY COMPACTED TO AVOID DISTORTING THE PIPE.
6. EMBANKMENT FILL (MORE THAN 12 INCHES ABOVE THE PIPE) SHALL CONSIST OF SOILS EXCAVATED AS PART OF THE WORK AS APPROVED BY THE OWNER'S REPRESENTATIVE. IF EXCAVATED SOILS ARE DEEMED UNSUITABLE, EMBANKMENT FILL SHALL CONSIST OF IMPORTED EARTHEN MATERIALS APPROVED BY THE OWNER'S REPRESENTATIVE. EMBANKMENT FILL SHALL BE PLACED IN HORIZONTAL LOOSE LIFTS NOT EXCEEDING TEN (10) INCHES IN THICKNESS AND MOISTURE CONDITIONED TO 1 PERCENT BELOW TO 3 PERCENT ABOVE STANDARD PROCTOR (ASTM D698) OPTIMUM MOISTURE CONTENT. EMBANKMENT FILL SHALL BE COMPACTED TO A MINIMUM OF 95 PERCENT OF THE STANDARD PROCTOR MAXIMUM DRY DENSITY.
7. FOR ALL UNDERGROUND PIPING, MARKING TAPE ENABLING DETECTION BY METAL DETECTOR (AS INDICATED IN THE SPECIFICATIONS) SHALL BE LOCATED ABOVE THE PIPE AT A DEPTH OF 1 TO 2 FEET BELOW THE FINISHED GRADE.

## HDPE PIPE INSTALLATION

1. FUSION MACHINE FOR BUTT FUSION OF HDPE PIPING SHALL BE FURNISHED BY THE CONTRACTOR.
2. ABOVE GRADE HDPE TO BE INSTALLED WITH AN EARTHEN BERM ANCHORAGE APPROXIMATELY EVERY 400 FEET WITH THE HDPE SNAKED BETWEEN ANCHORAGE POINTS APPROXIMATELY 20 FEET OFF A STRAIGHT LINE ALIGNMENT WITH 20 FEET HORIZONTAL CLEARANCE TO ALLOW THE HDPE PIPES TO EXPAND OR CONTRACT.
3. SECTIONS OF POLYETHYLENE PIPE SHOULD BE JOINED INTO CONTINUOUS LENGTHS ON THE JOBSITE ABOVE GROUND. THE JOINING METHOD SHALL BE THE BUTT FUSION METHOD AND SHALL BE PERFORMED IN STRICT ACCORDANCE WITH THE PIPE MANUFACTURER'S RECOMMENDATIONS BY CRAFT WORKERS CERTIFIED FOR THE FUSION MACHINE AND PIPING MATERIALS BEING UTILIZED. THE BUTT FUSION JOINING WILL PRODUCE A JOINT WITH WELD STRENGTH EQUAL TO OR GREATER THAN THE TENSILE STRENGTH OF THE PIPE ITSELF. ALL FIELD WELDS SHALL BE MADE WITH FUSION EQUIPMENT EQUIPPED WITH A DATA LOGGER. TEMPERATURE, FUSION PRESSURE AND A GRAPHIC REPRESENTATION OF THE FUSION CYCLE SHALL BE PART OF THE QUALITY CONTROL RECORDS.
4. MECHANICAL JOINING OF HDPE PIPE TO OTHER MATERIALS SHALL BE ACCOMPLISHED USING AN HDPE FLANGE ADAPTER WITH A DUCTILE IRON BACK-UP RING.
5. SOCKET FUSION, HOT GAS FUSION, THREADING, SOLVENTS, AND EPOXIES WILL NOT BE USED TO JOIN HDPE PIPE.
6. PRESSURE PIPING SYSTEMS CONSTRUCTED FROM HDPE MATERIAL SHALL BE LEAKAGE TESTED USING THE METHODOLOGY OUTLINED IN ASTM F2164, AND PER THE MANUFACTURER'S RECOMMENDATIONS AND THE PROJECT SPECIFICATIONS.

## STEEL PIPE INSTALLATION

1. COATING/PAINTING SHALL BE APPLIED AND TOUCHED UP AS DIRECTED BY THE OWNER.
2. ALL NEW PIPING WITHIN THE EXISTING PUMP STRUCTURE NEAR FGD-A POND SHALL BE SUPPORTED WITH MEMBERS CONSISTENT WITH THE EXISTING PIPE SUPPORTS IN THE STRUCTURE.
3. ALL WELDING SHALL BE COMPLETED BY QUALIFIED WELDERS.
4. ALL VALVES AND STEEL PIPING SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS

## SPECIFICATIONS

1. ALL MATERIALS AND INSTALLATION TO BE IN ACCORDANCE WITH THE SPECIFICATIONS OR OWNER APPROVED ALTERNATIVE SPECIFICATIONS.
2. CLAY LINER, GEOSYNTHETIC CLAY LINER (GCL), GEOMEMBRANE LINER, AND PROTECTIVE COVER SHALL BE PLACED IN ACCORDANCE WITH THE LINER QUALITY CONTROL PLAN.

## MATERIALS

1. CONTRACTOR IS RESPONSIBLE FOR PROCURING ADDITIONAL NEEDED QUANTITIES TO MAKE UP FOR SHORTAGES DUE TO LOSS, FIELD REVISIONS, WASTE, ETC.
2. CONTRACTOR TO FURNISH PLASTIC MARKING TAPE FOR NON-METALLIC UNDERGROUND PIPING IN ACCORDANCE WITH THE SPECIFICATION REQUIREMENTS.
3. ALL NEW SOLID WALL HDPE PIPING AND FITTINGS SHALL BE COMPOSED OF PE4710 RESIN CONSTRUCTED TO ASTM F714, OR ALTERNATE AS APPROVED BY THE OWNER'S REPRESENTATIVE.
4. ALL HDPE PIPING, FITTINGS, AND FLANGES SHALL HAVE IRON PIPE SIZING (IPS).
5. ALL NEW PERFORATED HDPE PIPING SHALL BE ADS N-12 PIPE.
6. ALL NEW STEEL PIPING AND FITTINGS SHALL BE ERW A53 STD SCHEDULE CARBON STEEL CONFORMING TO ASME 31.1 POWER PIPING.
7. ALL FLANGES SHALL CONFORM TO ASME B16.5 CLASS 150.
8. ALL PIPE, FITTINGS, FLANGES, AND VALVES FOR FGD-A TO PUMPS SUCTION LINE, FGD-B TO PUMPS SUCTION LINE, AND FGD-A TO FGD-B CROSSOVER LINE TO BE RATED FOR A 100 PSI DESIGN PRESSURE.
9. ALL THREADED FITTINGS SHALL HAVE NATIONAL PIPE THREAD (NPT) THREADS.
10. CONCRETE SHALL CONFORM TO ACI 318 AND ACI 301 AS APPLICABLE. THE CONCRETE MIX DESIGN APPROVED BY THE OWNER'S REPRESENTATIVE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 4,500 PSI. CONCRETE UTILIZED WITHIN THE FGD-A POND AND FGD-B POND SHALL BE SULFATE RESISTANT CONCRETE.
11. PIPE BEDDING AND EMBEDMENT SHALL CONSIST OF ON-SITE OR IMPORTED EARTHEN MATERIAL CLASSIFYING UNDER ASTM D2487 AS WELL-GRADED SAND (SW OR SW-SM) OR WELL-GRADED GRAVEL (GW OR GW-GM) OR AS OTHERWISE APPROVED IN WRITING BY THE OWNER'S REPRESENTATIVE. PIPE BEDDING SHALL CONTAIN NO PARTICLES LARGER THAN ½ INCH, AND FREE FROM ROOTS, DEBRIS, OR ANY OTHER SUBSTANCE THAT WOULD HARM THE PIPE OR MIGHT IMPAIR THE PERFORMANCE OF THE MATERIALS AS BEDDING OR EMBEDMENT FOR THE PIPE. FINAL MATERIAL SELECTION SHALL BE APPROVED BY THE OWNER'S REPRESENTATIVE.
12. CRUSHED STONE FOR ROADWAY SURFACING SHALL BE APPROVED BY OWNER'S REPRESENTATIVE.
13. WASHED GRAVEL FOR DRAIN LINE EMBEDMENT IN THE FGD-A POND AND FGD-B POND SHALL BE APPROVED BY OWNER'S REPRESENTATIVE.

**LEGEND**

- PROPOSED TOP OF EXCAVATED CLAY BREAKLINE
- PROPOSED TOP OF EXCAVATED CLAY 10-FT MAJOR CONTOUR
- PROPOSED TOP OF EXCAVATED CLAY 2-FT MINOR CONTOUR
- EXISTING GROUND 25-FT MAJOR CONTOUR
- EXISTING GROUND 5-FT MINOR CONTOUR
- SEE NOTE 3

**POINT GROUPS**

- 3000 — TOP OF EXCAVATED CLAY
- 3387 — SEE NOTE 4

**NOTES**

1. CONTROL POINTS ARE SET TO GENERALLY PROVIDE A MINIMUM 2.2-FT THICK CLAY FOLLOWING EXCAVATION. A 0.2-FT BUFFER IS INCLUDED TO ACCOUNT FOR POTENTIAL CLAY LAYER THICKNESS REDUCTION DURING RECOMPACTION.
2. THE FLOOR SHALL BE EXCAVATED TO A UNIFORM ELEVATION OF 421.20 FT
3. THE UPPER PORTION OF THE EXISTING CLAY LINER HAS BEEN ERODED. SEE DRAWING 10.
4. ATTENTION IS DRAWN TO POINTS SHOWN INSIDE A BORDER. BASED ON AS-BUILT INFORMATION, THESE POINTS MAY HAVE LESS THAN A 0.2-FT OF BUFFER.
5. EXCAVATIONS THROUGH FGD-A POND EMBANKMENT SHALL BE COMPLETED AT MAXIMUM SLOPES OF 2H:1V IN ACCORDANCE WITH CROSS SECTION A ON DRAWING 19, OR AN ALTERNATE EXCAVATION CONFIGURATION THAT MEETS APPLICABLE OSHA AND LUMINANT REQUIREMENTS.
6. PIPE INSTALLATION THROUGH THE FGD-A POND EMBANKMENT SHALL BE COMPLETED DURING THE LINER RETROFIT WORK. EMBANKMENT FILL (MORE THAN 12-INCHES ABOVE THE PIPE) SHALL CONSIST OF SOILS EXCAVATED AS PART OF THE WORK AS APPROVED BY THE OWNER'S REPRESENTATIVE. IF EXCAVATED SOILS ARE DEEMED UNSUITABLE, EMBANKMENT FILL SHALL CONSIST OF IMPORTED EARTHEN MATERIALS APPROVED BY THE OWNER'S REPRESENTATIVE. EMBANKMENT FILL SHALL BE PLACED IN HORIZONTAL LOOSE LIFTS NOT EXCEEDING 10-INCHES IN THICKNESS AND MOISTURE CONDITIONED TO 1 PERCENT BELOW TO 3 PERCENT ABOVE STANDARD PROCTOR (ASTM D698) OPTIMUM MOISTURE CONTENT. EMBANKMENT FILL SHALL BE COMPACTED TO A MINIMUM OF 95 PERCENT OF THE STANDARD PROCTOR MAXIMUM DRY DENSITY.
7. CLAY LINER (OR GENERAL FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL), GEOMEMBRANE LINER, AND PROTECTIVE COVER SHALL BE PLACED ON THE INSIDE FACE OF THE EMBANKMENT DURING THE LINER RETROFIT WORK IN ACCORDANCE WITH THE LINER QUALITY CONTROL PLAN.

**REFERENCES**

5. UNDERGROUND PIPING (THROUGH THE FGD-A POND EMBANKMENT) SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE PIPE PENETRATION THROUGH THE PROTECTIVE COVER, THE COMPACTED CLAY LINER, AND THE FIRST FIVE (5) FEET OF EMBANKMENT FILL SHALL NOT HAVE GRANULAR BEDDING OR BACKFILL.
6. NO PIPING OR CONCRETE SHOULD BE IN DIRECT CONTACT WITH THE GEOMEMBRANE. A 12-OZ NON-WOVEN GEOTEXTILE SHALL BE PLACED BETWEEN THE CONCRETE AND THE GEOMEMBRANE. A 60 mil HDPE GEOMEMBRANE RUB-SHEET SHALL BE TACK WELDED TO THE LINER IN AREAS WHERE PIPING IS RESTING ON THE LINER.
7. A SULFATE RESISTANT CONCRETE MIX DESIGN APPROVED BY THE OWNER'S REPRESENTATIVE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 4,500 PSI. CONCRETE COLLAR TO EXTEND APPROXIMATELY THREE (3) FEET AROUND THE RISER PIPE AND TO HAVE A MINIMUM OF 12 INCHES OF COVER ABOVE THE PIPE.
8. CONTRACTOR TO FIELD IDENTIFY TIE-IN LOCATION AND INDICATE ANY PROPOSED CHANGES TO TIE-IN FOR OWNER'S APPROVAL.
9. PIPE INSTALLATION THROUGH THE FGD-A POND EMBANKMENT SHALL BE COMPLETED DURING THE LINER RETROFIT WORK. CLAY LINER (OR GENERAL FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL), GEOMEMBRANE LINER, AND PROTECTIVE COVER SHALL BE PLACED ON THE INSIDE FACE OF THE EMBANKMENT DURING THE LINER RETROFIT WORK IN ACCORDANCE WITH THE LINER QUALITY CONTROL PLAN. PIPING WITHIN FGD-A POND SHALL BE COMPLETED AFTER PROTECTIVE COVER PLACEMENT.
10. THE PROPOSED FGD-A POND DRAIN LINE TO FOLLOW THE SAME PROFILE AS THE PROPOSED FGD-A POND TO FGD-B POND CROSSOVER PIPELINE THROUGH THE EMBANKMENT WHICH SEPARATES THE TWO PONDS. THE FGD-A POND DRAIN LINE SHALL BE DAYLIGHTED NEAR THE EXISTING KNIFE GATE VALVE ON THE FGD-A POND TO FGD-B POND CROSSOVER PIPELINE AND TERMINATED WITH A KNIFE GATE VALVE AND BLIND FLANGE.

**REFERENCE(S)**

1. EXISTING GROUND TOPOGRAPHY IS TAKEN FROM AERIAL SURVEYS PERFORMED BY LUMINANT MINING ON JANUARY 8, 2020 AND FEBRUARY 17, 2020.
2. AS-CONSTRUCTED SURVEY OF FGD-B POND PERFORMED BY SAM, INC. ON DECEMBER 7, 2011.
3. SURVEY CONTROL TAKEN FROM A DRAWING PREPARED BY SAM, INC. ENTITLED "SKETCH TO ACCOMPANY FIELD NOTE NO. 4851" SAM, INC. JOB NO. 26172-09. SITE CONTROL IS NAD83 TEXAS STATE PLANE CENTRAL ZONE. ELEVATIONS ARE BASED ON SITE BENCHMARKS AND ARE IN FEET-MEAN SEA LEVEL.

**NOTE(S)**

1. ALL LUMINANT AND APPLICABLE OSHA HEALTH AND SAFETY REQUIREMENTS SHALL BE FOLLOWED DURING EXECUTION OF THE WORK.
2. CONTRACTOR IS RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING UNDERGROUND, ABOVE-GRADE, AND OVERHEAD UTILITIES.
3. ALL NEW PIPING SHALL BE HIGH DENSITY POLYETHYLENE (HDPE) DR-11 (IRON PIPE SIZING) SOLID WALL UNLESS OTHERWISE INDICATED.
4. EXCAVATIONS THROUGH FGD-A POND EMBANKMENT SHALL BE COMPLETED AT MAXIMUM SLOPES OF 2H:1V IN ACCORDANCE WITH CROSS SECTION A ON DRAWING 19, OR AN ALTERNATE EXCAVATION CONFIGURATION THAT MEETS APPLICABLE OSHA AND LUMINANT REQUIREMENTS.
5. UNDERGROUND PIPING (THROUGH THE FGD-A POND EMBANKMENT) SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE PIPE PENETRATION THROUGH THE PROTECTIVE COVER, THE COMPACTED CLAY LINER, AND THE FIRST FIVE (5) FEET OF EMBANKMENT FILL SHALL NOT HAVE GRANULAR BEDDING OR BACKFILL.
6. NO PIPING OR CONCRETE SHOULD BE IN DIRECT CONTACT WITH THE GEOMEMBRANE. A 12-OZ NON-WOVEN GEOTEXTILE SHALL BE PLACED BETWEEN THE CONCRETE AND THE GEOMEMBRANE. A 60 mil HDPE GEOMEMBRANE RUB-SHEET SHALL BE TACK WELDED TO THE LINER IN AREAS WHERE PIPING IS RESTING ON THE LINER.
7. A SULFATE RESISTANT CONCRETE MIX DESIGN APPROVED BY THE OWNER'S REPRESENTATIVE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 4,500 PSI. CONCRETE COLLAR TO EXTEND APPROXIMATELY THREE (3) FEET AROUND THE RISER PIPE AND TO HAVE A MINIMUM OF 12 INCHES OF COVER ABOVE THE PIPE.
8. CONTRACTOR TO FIELD IDENTIFY TIE-IN LOCATION AND INDICATE ANY PROPOSED CHANGES TO TIE-IN FOR OWNER'S APPROVAL.
9. PIPE INSTALLATION THROUGH THE FGD-A POND EMBANKMENT SHALL BE COMPLETED DURING THE LINER RETROFIT WORK. EMBANKMENT FILL (MORE THAN 12 INCHES ABOVE THE PIPE) SHALL CONSIST OF SOILS EXCAVATED AS PART OF THE WORK AS APPROVED BY THE OWNER'S REPRESENTATIVE. IF EXCAVATED SOILS ARE DEEMED UNSUITABLE, EMBANKMENT FILL SHALL CONSIST OF IMPORTED EARTHEN MATERIALS APPROVED BY THE OWNER'S REPRESENTATIVE. EMBANKMENT FILL SHALL BE PLACED IN HORIZONTAL LOOSE LIFTS NOT EXCEEDING TEN (10) INCHES IN THICKNESS AND MOISTURE CONDITIONED TO 1 PERCENT BELOW TO 3 PERCENT ABOVE STANDARD PROCTOR (ASTM D698) OPTIMUM MOISTURE CONTENT. EMBANKMENT FILL SHALL BE COMPACTED TO A MINIMUM OF 95 PERCENT OF THE STANDARD PROCTOR MAXIMUM DRY DENSITY. CLAY LINER (OR GENERAL FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL), GEOMEMBRANE LINER, AND PROTECTIVE COVER SHALL BE PLACED ON THE INSIDE FACE OF THE EMBANKMENT DURING THE LINER RETROFIT WORK IN ACCORDANCE WITH THE LINER QUALITY CONTROL PLAN.

**NOTE(S)**

1. ALL LUMINANT AND APPLICABLE OSHA HEALTH AND SAFETY REQUIREMENTS SHALL BE FOLLOWED DURING EXECUTION OF THE WORK.
2. CONTRACTOR IS RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING UNDERGROUND, ABOVE-GRADE, AND OVERHEAD UTILITIES.
3. ALL NEW PIPING SHALL BE HIGH DENSITY POLYETHYLENE (HDPE) DR-11 (IRON PIPE SIZING) SOLID WALL UNLESS OTHERWISE INDICATED.
4. EXCAVATIONS THROUGH FGD-B POND EMBANKMENT SHALL BE COMPLETED AT MAXIMUM SLOPES OF 2H:1V IN ACCORDANCE WITH CROSS SECTION A ON DRAWING 19, OR AN ALTERNATE EXCAVATION CONFIGURATION THAT MEETS APPLICABLE OSHA AND LUMINANT REQUIREMENTS. THE EXISTING GEOMEMBRANE LINER SHALL BE CLEANLY CUT AND GENTLY PEELED AWAY FROM THE PROPOSED EXCAVATION. FOLLOWING COMPLETION OF THE PIPELINE, EMBANKMENT FILL, AND CLAY LINER (OR EMBANKMENT FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL) CONSTRUCTION, THE GEOMEMBRANE SHALL BE LAID BACK AND WELDED USING GEOMEMBRANE CAPSTRIPS AS APPROPRIATE.
5. UNDERGROUND PIPING (THROUGH THE FGD-B POND EMBANKMENT) SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE PIPE PENETRATION THROUGH THE PROTECTIVE COVER, THE COMPACTED CLAY LINER, AND THE FIRST FIVE (5) FEET OF EMBANKMENT FILL SHALL NOT HAVE GRANULAR BEDDING OR BACKFILL.
6. NO PIPING OR CONCRETE SHOULD BE IN DIRECT CONTACT WITH THE GEOMEMBRANE. A 12-OZ NON-WOVEN GEOTEXTILE SHALL BE PLACED BETWEEN THE CONCRETE AND THE GEOMEMBRANE. A 60 mil HDPE GEOMEMBRANE RUB-SHEET SHALL BE TACK WELDED TO THE LINER IN AREAS WHERE PIPING IS RESTING ON THE LINER.
7. A SULFATE RESISTANT CONCRETE MIX DESIGN APPROVED BY THE OWNER'S REPRESENTATIVE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 4,500 PSI. CONCRETE COLLAR TO EXTEND APPROXIMATELY THREE (3) FEET AROUND THE RISER PIPE AND TO HAVE A MINIMUM OF 12 INCHES OF COVER ABOVE THE PIPE.
8. EARTHEN BERM ANCHORAGES WILL BE PROVIDED AT APPROXIMATELY 400-FOOT INTERVALS ALONG THE FGD-B TO PUMPS SUCTION PIPELINE. PIPING BETWEEN THE EARTHEN BERMS SHALL BE SNAKED APPROXIMATELY 20 FEET OFF OF A STRAIGHT LINE ALIGNMENT WITH 20 FEET HORIZONTAL CLEARANCE TO ALLOW THE HDPE PIPES TO EXPAND OR CONTRACT.
9. CLEARING AND GRUBBING PLAN TO BE APPROVED BY OWNER.
10. LOCAL GRADING TO BE DONE ALONG THE ALIGNMENT TO MINIMIZE LOCALIZED HIGH AND LOW SPOTS.
11. EARTHEN CONTAINMENT BERM TO BE 4-FEET (MIN.) ABOVE EXISTING GRADES BETWEEN ALIGNMENT STATIONS 0+00 AND 2+50, AND TRANSITION TO BE 2-FEET (MIN.) ABOVE EXISTING GRADES BETWEEN ALIGNMENT STATIONS 2+50 AND 11+00.
12. CULVERT PIPING SHALL BE ADS N-12 ST IB HDPE PIPE OR EQUIVALENT APPROVED BY THE OWNER'S REPRESENTATIVE.
13. CULVERT THROUGH CONTAINMENT BERM SHALL BE SITUATED AT THE LOWEST ELEVATION ON THE UPSTREAM SIDE OF THE CONTAINMENT BERM AND SHALL BE ORIENTED TO ALLOW FOR DRAINAGE DURING PRECIPITATION EVENTS.

3. ALL NEW PIPING SHALL BE HIGH DENSITY POLYETHYLENE (HDPE) DR-11 (IRON PIPE SIZING) SOLID WALL UNLESS OTHERWISE INDICATED.
4. EXCAVATIONS THROUGH FGD-B POND EMBANKMENT SHALL BE COMPLETED AT MAXIMUM SLOPES OF 2H:1V IN ACCORDANCE WITH CROSS SECTION A ON DRAWING 19, OR AN ALTERNATE EXCAVATION CONFIGURATION THAT MEETS APPLICABLE OSHA AND LUMINANT REQUIREMENTS. THE EXISTING GEOMEMBRANE LINER SHALL BE CLEANLY CUT AND GENTLY PEELED AWAY FROM THE PROPOSED EXCAVATION. FOLLOWING COMPLETION OF THE PIPELINE, EMBANKMENT FILL, AND CLAY LINER (OR EMBANKMENT FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL) CONSTRUCTION, THE GEOMEMBRANE SHALL BE LAID BACK AND WELDED USING GEOMEMBRANE CAPSTRIPS AS APPROPRIATE.
5. UNDERGROUND PIPING (THROUGH THE FGD-B EMBANKMENT) SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE PIPE PENETRATION THROUGH THE PROTECTIVE COVER, THE COMPACTED CLAY LINER, AND THE FIRST FIVE (5) FEET OF EMBANKMENT FILL SHALL NOT HAVE GRANULAR BEDDING OR BACKFILL.
6. NO PIPING OR CONCRETE SHOULD BE IN DIRECT CONTACT WITH THE GEOMEMBRANE. A 12-OZ NON-WOVEN GEOTEXTILE SHALL BE PLACED BETWEEN THE CONCRETE AND THE GEOMEMBRANE.
7. A SULFATE RESISTANT CONCRETE MIX DESIGN APPROVED BY THE OWNER'S REPRESENTATIVE SHALL HAVE A MINIMUM 28-DAY COMPRESSIVE STRENGTH OF 4,500 PSI. CONCRETE COLLAR TO EXTEND APPROXIMATELY THREE (3) FEET AROUND THE RISER PIPE AND TO HAVE A MINIMUM OF 12 INCHES OF COVER ABOVE THE PIPE.
8. EMBANKMENT FILL (MORE THAN 12 INCHES ABOVE THE PIPE) SHALL CONSIST OF SOILS EXCAVATED AS PART OF THE WORK AS APPROVED BY THE OWNER'S REPRESENTATIVE. IF EXCAVATED SOILS ARE DEEMED UNSUITABLE, EMBANKMENT FILL SHALL CONSIST OF IMPORTED EARTHEN MATERIALS APPROVED BY THE OWNER'S REPRESENTATIVE. EMBANKMENT FILL SHALL BE PLACED IN HORIZONTAL LOOSE LIFTS NOT EXCEEDING TEN (10) INCHES IN THICKNESS AND MOISTURE CONDITIONED TO 1 PERCENT BELOW TO 3 PERCENT ABOVE STANDARD PROCTOR (ASTM D698) OPTIMUM MOISTURE CONTENT. EMBANKMENT FILL SHALL BE COMPACTED TO A MINIMUM OF 95 PERCENT OF THE STANDARD PROCTOR MAXIMUM DRY DENSITY. CLAY LINER (OR GENERAL FILL OVERLAID BY EQUIVALENT OWNER-APPROVED GCL), GEOMEMBRANE LINER, AND PROTECTIVE COVER SHALL BE PLACED ON THE INSIDE FACE OF THE EMBANKMENT IN ACCORDANCE WITH THE LINER QUALITY CONTROL PLAN AFTER CONSTRUCTING THE PIPELINES THROUGH THE EMBANKMENT.

SCALE N.T.S. 2/18 TYPICAL CLEANOUT

**NOTE(S)**

1. ALL LUMINANT AND APPLICABLE OSHA HEALTH AND SAFETY REQUIREMENTS SHALL BE FOLLOWED DURING EXECUTION OF THE WORK.
2. CONTINUOUS ONE-HALF-INCH STAINLESS STEEL CLAMPS WITH A GASKET BETWEEN THE HDPE PIPE AND HDPE LINER BELOW THE STEEL CLAMPS, AND A CONTINUOUS STRIP OF NEOPRENE RUBBER CUSHION BETWEEN THE STAINLESS STEEL CLAMPS AND THE HDPE LINER.
3. THE CULVERT CANAL GATE VALVE SHALL BE A WATERMAN C-10 CANAL GATE WITH HDPE ADAPTER, TUBE SEAL, AND BACK FRAME ATTACHMENTS OR AN EQUIVALENT APPROVED BY THE OWNER'S REPRESENTATIVE. CANAL GATE VALVES AND FITTINGS SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURERS RECOMMENDATIONS.
4. CULVERT PIPING SHALL BE ADS N-12 ST IB HDPE PIPE OR EQUIVALENT APPROVED BY THE OWNER'S REPRESENTATIVE.
5. CULVERT FITTINGS (METAL FLARED END SECTIONS, ETC.) SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS.
6. CULVERT SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDATIONS.
7. CONTRACTOR SHALL USE CARE WHEN COMPACTING EMBANKMENT FILL AROUND THE CULVERT AND SHALL USE HAND AND/OR REMOTE COMPACTION EQUIPMENT UNTIL THE PIPE HAS APPROXIMATELY 2-FEET OF COVER.

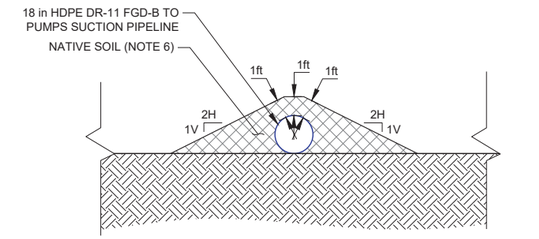
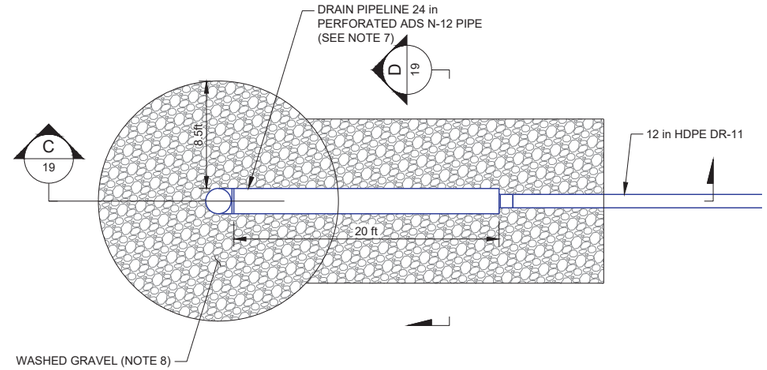
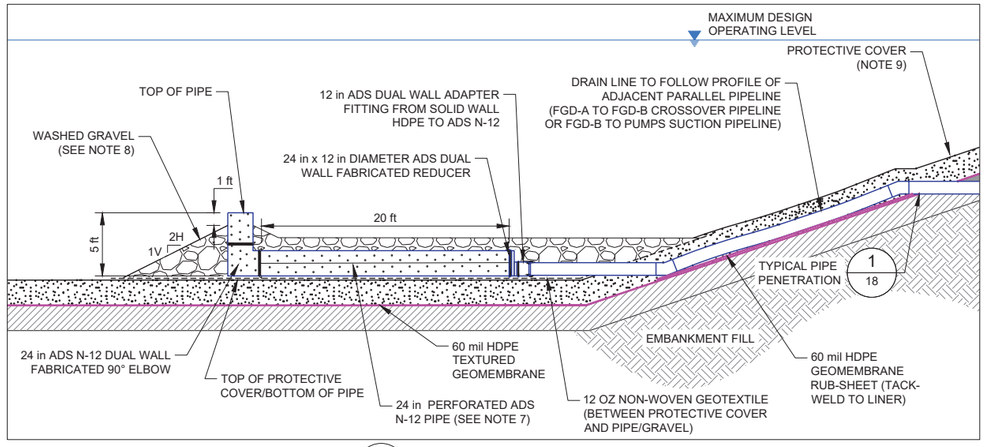
SCALE N.T.S. A 19 TYPICAL PIPE BACKFILL SECTION



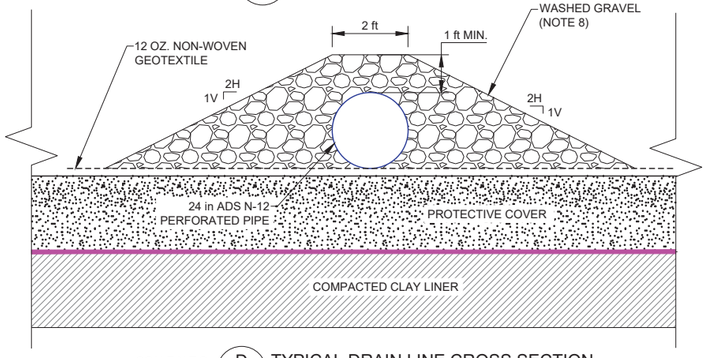
SCALE N.T.S. B 19 TYPICAL EARTHEN BERM (PIPE RESTRAINT)



SCALE N.T.S. 1 19 TYPICAL DRAIN LINE PLAN VIEW



SCALE N.T.S. C 19 TYPICAL DRAIN LINE PROFILE



SCALE N.T.S. D 19 TYPICAL DRAIN LINE CROSS SECTION

**NOTE(S)**

1. ALL LUMINANT AND APPLICABLE OSHA HEALTH AND SAFETY REQUIREMENTS SHALL BE FOLLOWED DURING EXECUTION OF THE WORK.
2. PIPE BEDDING AND EMBEDMENT SHALL CONSIST OF ON-SITE OR IMPORTED EARTHEN MATERIAL CLASSIFYING UNDER ASTM D2487 AS WELL-GRADED SAND (SW OR SW-SM) OR WELL-GRADED GRAVEL (GW OR GW-GM) OR AS OTHERWISE APPROVED IN WRITING BY THE OWNER'S REPRESENTATIVE. PIPE BEDDING SHALL CONTAIN NO PARTICLES LARGER THAN 0.5-INCH, AND FREE FROM ROOTS, DEBRIS, OR ANY OTHER SUBSTANCE THAT WOULD HARM THE PIPE OR MIGHT IMPAIR THE PERFORMANCE OF THE MATERIAL AS BEDDING FOR THE PIPE. FINAL MATERIAL SELECTION SHALL BE APPROVED BY THE OWNER'S REPRESENTATIVE.
3. UNDERGROUND PIPING SHALL BE BEDDED ON THREE (3) INCHES OF GRANULAR PIPE BEDDING MATERIAL AND EMBEDDED IN THE SAME MATERIAL TO TWELVE (12) INCHES ABOVE THE TOP OF THE PIPING. THE MATERIAL DIRECTLY ABOVE THE PIPE IN THE EMBEDMENT ZONE SHALL BE ONLY LIGHTLY COMPACTED TO AVOID DISTORTING THE PIPE.
4. EMBANKMENT FILL (MORE THAN 12 INCHES ABOVE THE PIPE) SHALL CONSIST OF SOILS EXCAVATED AS PART OF THE WORK AS APPROVED BY THE OWNER'S REPRESENTATIVE. IF EXCAVATED SOILS ARE DEEMED UNSUITABLE, EMBANKMENT FILL SHALL CONSIST OF IMPORTED EARTHEN MATERIALS APPROVED BY THE OWNER'S REPRESENTATIVE. EMBANKMENT FILL SHALL BE PLACED IN HORIZONTAL LOOSE LIFTS NOT EXCEEDING TEN (10) INCHES IN THICKNESS AND MOISTURE CONDITIONED TO 1 PERCENT BELOW TO 3 PERCENT ABOVE STANDARD PROCTOR (ASTM D698) OPTIMUM MOISTURE CONTENT. EMBANKMENT FILL SHALL BE COMPACTED TO A MINIMUM OF 95 PERCENT OF THE STANDARD PROCTOR MAXIMUM DRY DENSITY.
5. FOR ALL UNDERGROUND PIPING, MARKING TAPE ENABLING DETECTION BY METAL DETECTOR (AS INDICATED IN THE SPECIFICATIONS) SHALL BE LOCATED ABOVE THE PIPE AT A DEPTH OF 1 TO 2 FEET BELOW THE FINISHED GRADE.
6. MATERIAL FOR EARTHEN BERM USED TO ANCHOR HDPE PIPE TO BE SPECIFIED BY OWNER. EARTHEN BERM TO EXTEND 6 FEET ALONG LENGTH OF PIPE.
7. DRAIN LINE PIPING WITHIN BOTH PONDS TO BE PERFORATED 24 inch ADS N-12 ST IB (SOIL TIGHT) PIPE AND FITTINGS. ADS PIPE TO BE INSTALLED PER MANUFACTURER'S RECOMMENDATIONS.
8. PERFORATED DRAIN LINE PIPING WITHIN THE POND TO BE SURROUNDED WITH WASHED GRAVEL (GRAVEL TO BE APPROVED BY OWNER) AS SHOWN ON THE DRAWINGS (I.E. MINIMUM 12 INCHES AROUND THE DRAIN PIPE).
9. EXTEND PROTECTIVE COVER TO EMBANKMENT CREST IN FGD-B POND, PROTECTIVE COVER ENDS AT ELEV. 425.5 FT IN FGD-A POND.

# 1.0 INTRODUCTION

Oak Grove Management Company LLC (Oak Grove) owns and operates the Oak Grove Steam Electric Station (OGSES) located approximately ten miles north of Franklin in Robertson County, Texas. The power plant and related support areas are located along the south side of Twin Oak Reservoir (Figure 1). The OGSES consists of two lignite-fired units with a combined operating capacity of approximately 1,796 megawatts. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operation. The CCRs are transported off-site for beneficial use by third-parties or are disposed at the OGSES Ash Landfill 1.

The U.S. Environmental Protection Agency promulgated 40 C.F.R. Part 257, Subpart D (the CCR Rule) and the Texas Commission on Environmental Quality (TCEQ) promulgated 30 T.A.C. Chapter 352 (which largely adopts the federal CCR Rule by reference) to establish technical requirements for new and existing CCR landfills and surface impoundments. On June 28, 2021, USEPA approved the majority of TCEQ's CCR program, which will now operate in lieu of the federal regulations. FGD-A, FGD-B, and FGD-C (collectively the "FGD Ponds") at the OGSES have been identified as Existing CCR Surface Impoundments regulated under the CCR Rule.

Section 257.73(d) specifies that periodic structural stability assessments must be conducted for each CCR surface impoundment and 30 T.A.C. 352.731 adopts this requirement by reference. In accordance with § 257.73(g), the initial Structural Stability Assessments for the FGD Ponds was completed and placed in the facility operating record in November 2016 (Golder, 2016). As specified in § 257.73(f)(3), the Structural Stability Assessment must be updated every five years from the completion date of the initial plan. Golder Associates Inc., member of WSP (Golder), was retained by Luminant to prepare this updated Structural Stability Assessment for the FGD Ponds.

## 1.1 Description of FGD Ponds

The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (Figure 1) and are constructed above grade and surrounded by engineered earthen dikes that extend up to approximately 25 feet above surrounding grade.

The FGD Ponds receive wastewater from the FGD wet scrubber system blowdown, low volume wastewater, bottom ash contact water, and storm water runoff from approximately 41 acres of the power plant. All fluids are pumped into the FGD Ponds and there are no uncontrolled or gravity inflows into the ponds, with the exception of a gravity overflow from FGD-A to FGD-B. Process wastewater can be transferred between the FGD Ponds and is used as makeup water to the FGD scrubber system and related purposes. The are no spillways or other uncontrolled gravity flow releases from the ponds. Solids that accumulate in the FGD ponds are periodically removed and transported to OGSES Ash Landfill 1.

FGD-A covers an area of approximately 9.5 acres and was constructed in 2008. FGD-A is currently lined with a 3-foot thick compacted clay liner; however, FGD-A ceased receipt of waste by April 11, 2021, and Oak Grove has initiated the retrofit of FGD-A with a composite liner system meeting the requirements of § 257.71(a)(1)(ii).

FGD-B covers an area of approximately 12 acres and was constructed in 2011. FGD-B is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain be a 60-mil HDPE geomembrane liner, overlain by a 1-foot thick layer of protective soil. The composite liner system in FGD-B complies with the requirements of §257.71(a)(1)(ii).

FGD-C is approximately 25 acres and was constructed in 2016. FGD-C is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner,

overlain by a 2-foot thick soil/ash protective layer. The composite liner system in FGD-C complies with the requirements of §257.71(a)(1)(ii).

## 1.2 Previous Slope Stability Evaluations

The Initial Structural Assessment for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016). No structural stability deficiencies were identified in the surface impoundments during the initial assessment.

In addition, Golder performed previous evaluations on the FGD-A, and FGD-B ponds as part of the below reports submitted to Luminant:

- FGD-B Slope Stability Investigation Report (Revised), Luminant Oak Grove SES, Robertson County, Texas, dated June 2010
- FGD-A Slope Stability Evaluation Report, Luminant Oak Grove SES, Robertson County, Texas, dated March 2011
- Addendum to Slope Stability Investigation Reports Luminant Oak Grove SES, Robertson County, Texas, March 2014

These studies found the pond slopes to be adequately stable.

Construction of FGD-C Pond was completed in 2016. During the design of FGD-C Pond, Golder evaluated the stability of the embankments.

# 2.0 SUBSURFACE CONDITIONS

## 2.1 Regional Geology

The OGSES site is located in the Sandy Hills physiographic province of Texas. Ground elevations range from 400 to 425 feet MSL (mean sea level), and the topography is characterized by low rolling hills and shallow stream valleys (Espey, Huston & Associates, 1987). The regional terrain consists of a thick series of unconsolidated sediments consisting of sand, silt, clay, and lignite. The major geologic units are the tertiary age 'bedrock' strata and the quaternary age fluviatile deposits. Eroded bedrock is overlain by alluvium and terraces along the valleys of larger streams. The approximate thickness of alluvium in the area of the site varies from 0 to 50 ft. The alluvium typically consists of sand, silt, silty clay and sandy clay and is not easily differentiated from the underlying bedrock strata in many instances.

## 2.2 Site Geology

### 2.2.1 Subsurface Investigations and Laboratory Testing

Information from previous subsurface investigations was used to characterize the subsurface site conditions. Golder conducted a subsurface investigation for the FGD-A Pond in July 2008, prior to construction of the clay liner within the pond. Golder completed nine borings within the pond footprint with boring depths ranging from 16 to 28 feet below ground surface (bgs) (Golder, 2008). Golder also conducted a subsurface investigation for the FGD-B Pond in March 2010 (Golder, 2010). In December 2014, Golder completed another subsurface investigation including ten geotechnical boreholes and installation of 3 groundwater monitoring wells, to facilitate design and construction of the FGD-C Pond. Appendix A of the initial Structural Stability Assessment (Golder2016) includes the boring location maps and select, representative boring logs.

For each investigation, laboratory testing was performed on selected samples, in accordance with commonly accepted methods and practices. Undisturbed and disturbed soil samples were tested to determine water content, Atterberg limits, grain size distribution, and shear strength. Water content determination was performed in accordance with ASTM D2216; Atterberg limits were determined in accordance with ASTM D4318; and grain size distribution was performed in accordance with ASTM D422. Shear strength testing consisted of unconsolidated-undrained (UU) and consolidated-undrained (CU) triaxial compression tests in general accordance with ASTM D2850 and D4767, respectively. Laboratory data are presented in Appendix B of the initial Structural Stability Assessment (Golder, 2016).

The findings from the above subsurface investigations were reviewed for their applicability to this study and are summarized in the following sections.

### 2.2.2 Subsurface Site Conditions

#### *2.2.2.1 FGD-A Pond*

The soils encountered under the FGD-A Pond consist of lean clays, sandy clays, silty clays, sands, silty sands, clayey sands, and sandy silts. The near surface soils under the pond generally consist of fine- grained soils extending to depths ranging from approximately 6 feet to more than 19 feet below the pond bottom. Coarse-grained soils (i.e., sands) were generally encountered at depths greater than 6 feet below the pond bottom. Sands were encountered at shallower depths in the northwest portion of the pond than in the southeast portion of the pond.

Historical monitoring well measurements near the FGD-A Pond indicate that the groundwater level is between approximately 406 and 411 ft-msl.

#### 2.2.2.2 FGD-B Pond

The soils encountered in the borings generally consisted of very stiff to hard clays and compact to very dense sands. The surficial soils were generally classified as very stiff to hard sandy (lean and fat) clay and ranged in thickness from 8 to 27 ft. The surficial clay stratum was underlain by layers of compact to very dense sand, clayey sand, silty sand, and/or very stiff to hard silty clay or clay.

Historical monitoring well measurements near FGD-B Pond indicate that the groundwater level is between approximately 405 and 411 ft-msl.

#### 2.2.2.3 FGD-C Pond

Based on the results of the geotechnical investigations at this facility, soils in the footprint of the FGD-C Pond in general comprise the following:

- Laminated clays, silty clays and sandy clays having low horizontal and vertical hydraulic conductivity;
- Thinly bedded clays, clayey silts, and silty sands characterized by low to moderate horizontal permeability and low net vertical permeability; and
- Bedded sands, silty sands, clayey sands, and silts of moderate to relatively high horizontal and moderate vertical permeability.

Based on monitoring well measurements near FGD-C, the groundwater level ranges from approximately 410 ft-msl to 413 ft-msl.

# 3.0 SITE RECONNAISSANCE

Following a review of the structural stability assessment and past inspection reports, Golder performed a site reconnaissance on October 7, 2021 to observe conditions at the crest, downstream slopes, and areas beyond the FGD Ponds. With the exception of portions of the FGD-A Pond where the CCR has been removed in preparation for retrofitting, it was not feasible to observe the conditions of the upstream slopes below the water level.

During the site visit no items of concern were noted.

# 4.0 UPDATED STRUCTURAL STABILITY ASSESSMENT - §257.73(d)(1)(i)-(vii)

The CCR rules require conducting periodic structural stability assessments by a qualified professional engineer to document whether the design, construction, operation and maintenance is consistent with recognized and generally accepted good engineering practices for the maximum volume of CCR and CCR wastewater that can be impounded therein.

## 4.1 Foundations and Abutments - §257.73(d)(1)(i)

As noted above, the foundation soils consist of native soils and fill. The foundation soils and abutments are stable.

## 4.2 Slope Protection - §257.73(d)(1)(ii)

The downstream slopes of the embankments in each FGD pond are protected from erosion and deterioration by the establishment of a vegetative cover. The vegetative cover is inspected weekly for erosion, signs of seepage, animal burrows, sloughing, and plants that could negatively impact the embankment.

## 4.3 Dikes (Embankment) - §257.73(d)(1)(iii)

Each of the embankments was constructed of compacted site soils. No construction testing of the original embankment fill in FGD-A and FGD-B Ponds are available.

As described in Section 4.6 (Hydraulic Structures), the retrofitting will include removal and replacement of crossover pipeline through the northern embankment of the FGD-A Pond and installation of a suction pipeline and drain line through the southeastern corner of the FGD-B Pond embankment. This will require removal and replacement of fill along embankments. The technical specifications for embankment fill require placement in loose horizontal lifts not exceeding 10 inches and compaction to 95% of the maximum dry density and within -1% to +3% of the optimum water content as determined by the standard Proctor test (ASTM D698).

In 2011, the base and embankment elevations of FGD-B Pond were raised, and the pond was lined with a composite geomembrane/clay liner system. The subgrade was raised 5 feet using structural fill to increase the separation depth from the groundwater. Approximately 150,000 cy of structural fill was placed in 6-inch lifts and compacted to 95% of the maximum standard Proctor dry density.

The FGD-C Pond embankment was constructed of compacted site soils, placed in 6-inch lifts compacted to 95% of the standard Proctor maximum dry density and within -1% to +3% of the standard Proctor optimum water content. FGD-C Pond is lined with a composite liner consisting of a 2-ft thick clay liner, a 60-mil HDPE geomembrane and a 2-ft thick soil/ash protective cover. The clay liner was placed in 6-inch thick lifts compacted to achieve a hydraulic conductivity of less than 1 x $10^{-7}$ cm/s.

Based on a review of past inspection reports and on recent observations, each of the embankments are sufficient to withstand the range of loading conditions they are subjected to.

## 4.4 Vegetated Slopes - §257.73(d)(1)(iv)

The exterior slopes of the surface impoundments at the OGSES are vegetated to control erosion. Luminant maintains the vegetation in a manner that ensures that the weekly inspections required under the CCR Rule can be conducted; however, the height of the vegetation varies depending on the frequency of maintenance.

The US Court of Appeals for the District of Columbia Circuit remanded and vacated the CCR Rule requirement that vegetation on the exterior portions of dikes on CCR surface impoundments be maintained not to exceed 6 inches in height. EPA proposed to address this requirement in 2018 but it has not finalized any new requirements.

## 4.5 Spillways - §257.73(d)(1)(v)

There are no spillways on any of the surface impoundments.

## 4.6 Hydraulic Structures - §257.73(d)(1)(v)

Sludge and waste water enter FGD-A Pond through high density polyethylene (HDPE) pipes near the southern portion of the eastern embankment. Water can be recycled from FGD-A Pond back to the SES through three pipes connecting to a reclaim/recycling pump station located near the northern portion of the eastern embankment. A 12-inch HDPE crossover pipeline located across the pond from the inlet pipes connects the FGD-A Pond to FGD-B Pond. Flow through this pipe is controlled with a valve located near the toe of the western embankment.

As part of the FGD-A Pond retrofitting, the HDPE inlet pipes will be removed, and new pipes will be installed near the crest of the embankment. In addition, the existing 12-inch crossover pipeline will be removed and replaced with an 18-inch diameter HPE crossover pipeline approximately 9 feet lower through the north embankment. The new pipeline will tie in to the existing gate valve.

Currently, there are no pipes that pass through or under the FGD-B embankment.

Sludge and waste water enter FGD-C through HDPE pipes passing above the embankment crest elevation near the southwestern corner of the pond. There are two pipes that pass through the embankment: a 24- inch diameter HDPE recycle/reclaim pipe and a 12-inch diameter drain pipe located near the middle of the eastern pond embankment. Water can be recycled from the FGD-C Pond back to the SES through the 24- inch diameter HDPE recycle/reclaim pipe that ties into the FGD-A Pond Pump station. The water in FGD- C can also be drained by the 12-inch diameter pipe which can be connected to the 24-inch diameter HDPE recycle/reclaim pipe when needed.

No significant deterioration, deformation, distortion, bedding deficiencies, sedimentation, or debris were observed that may negatively affect the operation of the surface impoundments.

## 4.7 Downstream Slopes Adjacent to Water Body - §257.73(d)(1)(vii)

The west side of the FGD-B Pond borders a cove off of the Twin Oak Reservoir. This man-made reservoir is designed for a maximum water surface at EL 410 ft-msl. The toe of the FGD-B west embankment is at an elevation of approximately 420 ft-msl; therefore, the embankment will likely never be inundated and never subjected to rapid drawdown.

## 4.8 Structural Stability Deficiencies - §257.73(d)(2)

No structural stability deficiencies were identified during this assessment.

# 5.0 CONCLUSIONS

Based on our review of the information provided by Oak Grove, on information prepared by Golder Associates Inc., and on our on-site observations, no structural stability deficiencies were identified in the surface impoundments during this assessment.

Slope Stability Analysis Results

# 1.0 INTRODUCTION

Oak Grove Management Company LLC (Oak Grove) owns and operates the Oak Grove Steam Electric Station (OGSES) located approximately ten miles north of Franklin in Robertson County, Texas. The power plant and related support areas are located along the south side of Twin Oak Reservoir (Figure 1). The OGSES consists of two lignite-fired units with a combined operating capacity of approximately 1,796 megawatts. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operation. The CCRs are transported off-site for beneficial use by third-parties or are disposed at the OGSES Ash Landfill 1.

The U.S. Environmental Protection Agency promulgated 40 C.F.R. Part 257, Subpart D (the CCR Rule) and the Texas Commission on Environmental Quality (TCEQ) promulgated 30 T.A.C. Chapter 352 (which largely adopts the federal CCR Rule by reference) to establish technical requirements for new and existing CCR landfills and surface impoundments. On June 28, 2021, USEPA approved the majority of TCEQ's CCR program, which will now operate in lieu of the federal regulations. FGD-A, FGD-B, and FGD-C (collectively the "FGD Ponds") at the OGSES have been identified as Existing CCR Surface Impoundments regulated under the CCR Rule.

Section 257.73(e) of the CCR Rule specifies that periodic safety factor assessments must be conducted for each CCR surface impoundment and 30 T.A.C. 352.731 adopts this requirement by reference. In accordance with § 257.73(g), the initial Safety Factor Assessments for the FGD Ponds was completed and placed in the facility operating record in November 2016 (Golder, 2016). As specified in § 257.73(f)(3), the Safety Factor Assessment must be updated every five years from the completion date of the initial plan. Golder Associates Inc., member of WSP (Golder), was retained by Luminant to prepare this updated Safety Factor Assessment for the FGD Ponds.

## 1.1 Description of FGD Ponds

The FGD Ponds are located approximately 2,500 feet northwest of the OGSES power generation units (Figure 1) and are constructed above grade and surrounded by engineered earthen dikes that extend up to approximately 25 feet above surrounding grade.

The FGD Ponds receive wastewater from the FGD wet scrubber system blowdown, low volume wastewater, bottom ash contact water, and storm water runoff from approximately 41 acres of the power plant. All fluids are pumped into the FGD Ponds and there are no uncontrolled or gravity inflows into the ponds, with the exception of a gravity overflow from FGD-A to FGD-B. Process wastewater can be transferred between the FGD Ponds and is used as makeup water to the FGD scrubber system and related purposes. The are no spillways or other uncontrolled gravity flow releases from the ponds. Solids that accumulate in the FGD ponds are periodically removed and transported to OGSES Ash Landfill 1.

FGD-A covers an area of approximately 9.5 acres and was constructed in 2008. FGD-A is currently lined with a 3-foot thick compacted clay liner; however, FGD-A ceased receipt of waste by April 11, 2021, and Oak Grove has initiated the retrofit of FGD-A with a composite liner system meeting the requirements of § 257.71(a)(1)(ii).

FGD-B covers an area of approximately 12 acres and was constructed in 2011. FGD-B is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain be a 60-mil HDPE geomembrane liner, overlain by a 1-foot thick layer of protective soil. The composite liner system in FGD-B complies with the requirements of § 257.71(a)(1)(ii).

FGD-C is approximately 25 acres and was constructed in 2016. FGD-C is constructed with a composite liner consisting of a minimum 2-foot thick compacted clay liner, overlain by a 60-mil HDPE geomembrane liner,

overlain by a 2-foot thick soil/ash protective layer. The composite liner system in FGD-C complies with the requirements of § 257.71(a)(1)(ii).

## 1.2 Previous Slope Stability Evaluations

As required under § 257.73(e)(1), the Initial Factor of Safety Assessment for the FGD Ponds was completed and placed in the OGSES operating record in October 2016 (Golder, 2016). The calculated factors of safety met the minimum criteria presented in § 257.73(e)(i) through (iv).

In addition, Golder performed previous evaluations on the FGD-A, and FGD-B ponds as part of the below reports submitted to Luminant:

- FGD-B Slope Stability Investigation Report (Revised), Luminant Oak Grove SES, Robertson County, Texas, dated June 2010
- FGD-A Slope Stability Evaluation Report, Luminant Oak Grove SES, Robertson County, Texas, dated March 2011
- Addendum to Slope Stability Investigation Reports Luminant Oak Grove SES, Robertson County, Texas, March 2014

These studies found the pond slopes to be adequately stable.

Construction of FGD-C Pond was completed in 2016. During the design of FGD-C Pond, Golder evaluated the stability of the embankments.

# 2.0 SUBSURFACE CONDITIONS

## 2.1 Regional Geology

The OGSES site is located in the Sandy Hills physiographic province of Texas. Ground elevations range from 400 to 425 feet MSL (mean sea level), and the topography is characterized by low rolling hills and shallow stream valleys (Espey, Huston & Associates, 1987). The regional terrain consists of a thick series of unconsolidated sediments consisting of sand, silt, clay, and lignite. The major geologic units are the tertiary age 'bedrock' strata and the quaternary age fluviatile deposits. Eroded bedrock is overlain by alluvium and terraces along the valleys of larger streams. The approximate thickness of alluvium in the area of the site varies from 0 to 50 ft. The alluvium typically consists of sand, silt, silty clay and sandy clay and is not easily differentiated from the underlying bedrock strata in many instances.

## 2.2 Site Geology

### 2.2.1 Subsurface Investigations and Laboratory Testing

Information from previous subsurface investigations was used to characterize the subsurface site conditions. Golder conducted a subsurface investigation for the FGD-A pond in July 2008, prior to construction of the clay liner within the pond. Golder completed nine borings within the pond footprint with boring depths ranging from 16 to 28 feet below ground surface (bgs) (Golder, 2008). Golder also conducted a subsurface investigation for FGD-B pond in March 2010 (Golder, 2010). In December 2014, Golder completed another subsurface investigation including ten geotechnical boreholes and installation of 3 groundwater monitoring wells, to facilitate design and construction of the FGD-C pond. Appendix A of the initial Factor of Safety Assessment (Golder, 2016) includes the boring location maps and select, representative boring logs.

For each investigation, laboratory testing was performed on selected samples, in accordance with commonly accepted methods and practices. Undisturbed and disturbed soil samples were tested to determine water content, Atterberg limits, grain size distribution, and shear strength. Water content determination was performed in accordance with ASTM D2216; Atterberg limits were determined in accordance with ASTM D4318; and grain size distribution was performed in accordance with ASTM D422. Shear strength testing consisted of unconsolidated-undrained (UU) and consolidated-undrained (CU) triaxial compression tests in general accordance with ASTM D2850 and D4767, respectively. Laboratory test results are presented in Appendix B of the initial Factor of Safety Assessment (Golder, 2016).

The findings from the above subsurface investigations were reviewed for their applicability to this study and are summarized in the following sections.

### 2.2.2 Subsurface Site Conditions

#### *2.2.2.1 FGD-A Pond*

The soils encountered under the FGD-A Pond consist of lean clays, sandy clays, silty clays, sands, silty sands, clayey sands, and sandy silts. The near surface soils under the pond generally consist of fine- grained soils extending to depths ranging from approximately 6 feet to more than 19 feet below the pond bottom. Coarse-grained soils (i.e., sands) were generally encountered at depths greater than 6 feet below the pond bottom. Sands were encountered at shallower depths in the northwest portion of the pond than in the southeast portion of the pond.

Historical monitoring well measurements near the FGD-A Pond indicate that the groundwater level is between approximately 406 and 411 ft-msl.

#### 2.2.2.2 FGD-B Pond

The soils encountered in the borings generally consisted of very stiff to hard clays and compact to very dense sands. The surficial soils were generally classified as very stiff to hard sandy (lean and fat) clay and ranged in thickness from 8 to 27 ft. The surficial clay stratum was underlain by layers of compact to very dense sand, clayey sand, silty sand, and/or very stiff to hard silty clay or clay.

Based on monitoring well measurements near FGD-B, the groundwater level ranges from approximately 405 to 411 ft-msl.

#### 2.2.2.3 FGD-C Pond

Based on the results of the geotechnical investigations at this facility, soils in the footprint of the FGD-C Pond in general comprise the following:

- Laminated clays, silty clays and sandy clays having low horizontal and vertical hydraulic conductivity;
- Thinly bedded clays, clayey silts, and silty sands characterized by low to moderate horizontal permeability and low net vertical permeability; and
- Bedded sands, silty sands, clayey sands, and silts of moderate to relatively high horizontal and moderate vertical permeability.

Based on monitoring well measurements near FGD-C, the groundwater level ranges from approximately 410 ft-msl to 413 ft-msl.

# 3.0 UPDATED STABILITY ANALYSIS - § 257.73(e)

## 3.1 Safety Factor Assessment

According to the CCR rules, structural stability factors of safety need to be evaluated for the critical cross- section of each CCR facility under static and seismic loading for “Maximum Storage Pool” (2 feet of freeboard for this facility) and “Maximum Surcharge Pool” conditions. Liquefaction potential analysis is only necessary when soil sampling, construction documentation or anecdotal evidence from personnel with knowledge about the facility, indicates that soils of the embankment are susceptible to liquefaction.

None of the FGD Ponds have downstream slopes that could be inundated by the pool of an adjacent water body; therefore, rapid-drawdown loading conditions were not evaluated.

Slope stability analyses were performed using a limit-equilibrium-based commercial computer program, Slide v7.0 by Rocscience. The analyses used a searching routine to identify the potential failure surface with minimum factor of safety for a given set of geometry, ground and groundwater conditions. The Spencer method of analysis was used in the analyses, while the Morgenstern-Price method was used for verification. The factors of safety of numerous potential failure surfaces were computed to establish minimum factors of safety. Circular failure surfaces were considered for all cases except for section B1-B1’ (discussed later) that has a thin layer of silt, and hence, a block failure produces a lower factor of safety. Stability analyses were performed for “Maximum Storage Pool” (freeboard of 2 feet) and “Maximum Surcharge Pool” (no freeboard) conditions for both the interior and exterior slopes of the ponds. In addition, the interior slopes were analyzed while the pond is empty. For each case, respective slopes were analyzed for both static and seismic loading conditions.

## 3.2 Cross-Sections Analyzed

After considering multiple cross-sections a critical cross-section was identified for each pond and used for the stability analysis. The critical cross-section was determined considering the geometry of the slopes, soil profile, phreatic surface and loading conditions. More than one cross-section was used when required. For example, the critical section for the interior slopes of FGD-B is located to the east bordering pond FGD-A. However, since FGD-A adjoins FGD-B here, the critical section for exterior slopes of FGD-B is not located on this section. Hence, another section is analyzed on the west side of FGD-B to evaluate the exterior slopes. The critical cross-sections analyzed – A-A’, B-B’, B1-B1’, C-C’ – for each pond are shown in Figure 1.

## 3.3 Material Properties

Based on the previous subsurface investigations, appropriate material properties were selected for use in the stability analysis. Table 1, Table 2, Table 3, and Table 4 summarize the material properties used in the stability analysis.

Espey, Huston & Associates, 1987 present boreholes drilled on the embankment of FGD-A composed of structural fill. The borings on the embankment crest and the slopes show high pocket penetrometer values of 4.5 tons/ft$^2$ or above, indicating considerably hard clays. Also, we reviewed the Atterberg limits on samples collected from fill at the FGD-C pond. Based on these values, a conservative shear strength was assumed for the structural fill as shown in the below tables.

**Table 1: Soil Properties for Section A-A'**

| Soil Material | Description | Moist Unit Weigh (lb./ft$^3$) | Saturated Unit Weigh (lb./ft$^3$) | Drained Soil Properties | |
|---|---|---|---|---|---|
| | | | | Cohesion, c'(lb./ft$^2$) | Friction Angle, ϕ'(°) |
| I | Sandy Clay | 127 | 132 | 270 | 26 |
| II | Silty Clay/ Clay | 127 | 132 | 0 | 26 |
| III | Clayey Sand | 127 | 132 | 0 | 32 |

**Table 2: Soil Properties for Section B-B'**

| Soil Material | Description | Moist Unit Weigh (lb./ft$^3$) | Saturated Unit Weigh (lb./ft$^3$) | Drained Soil Properties | |
|---|---|---|---|---|---|
| | | | | Cohesion, c'(lb./ft$^2$) | Friction Angle, ϕ'(°) |
| I | Clay/ Silty Clay/ Sandy Clay | 127 | 132 | 270 | 26 |
| II | Sandy Silt | 127 | 132 | 0 | 26 |
| III | Sand/ Silty Sand | 127 | 132 | 0 | 36 |
| | Structural Fill | 127 | 132 | 270 | 26 |

**Table 3: Soil Properties for Section B1-B1'**

| Soil Material | Description | Moist Unit Weigh (lb./ft$^3$) | Saturated Unit Weigh (lb./ft$^3$) | Drained Soil Properties | |
|---|---|---|---|---|---|
| | | | | Cohesion, c'(lb./ft$^2$) | Friction Angle, ϕ'(°) |
| I | Clay/ Silty Clay/ Sandy Clay | 127 | 132 | 270 | 26 |
| II | Sand/ Silty Sand | 127 | 132 | 0 | 36 |
| | Structural Fill | 127 | 132 | 270 | 26 |

**Table 4: Soil Properties for Section C-C'**

| Soil Material | Description | Moist Unit Weigh (lb./ft$^3$) | Saturated Unit Weigh (lb./ft$^3$) | Drained Soil Properties | |
|---|---|---|---|---|---|
| | | | | Cohesion, c'(lb./ft$^2$) | Friction Angle, ϕ'(°) |
| I | New Fill - compacted onsitelow to moderate plasticity clay soils | 125 | n/a | 200 | 26 |
| II | Existing Fill - stiffto very stiff clays | 125 | n/a | 150 | 24 |
| III | Very stiff Silty Clay | 127 | 132 | 270 | 26 |
| IV | Very dense Silty Sand | 120 | 130 | n/a | 34 |

## 3.4 Phreatic Surface

For the stability analysis, the location of the phreatic surface within the FGD-A Pond embankment was conservatively assumed to correspond to the water level in the pond and to the ground surface of the exterior slope of the embankment. The only exception to this is Case 5a and 5b for FGD-B, where the phreatic surface from the adjoining FGD-A embankment was assumed to slope at approximately 3H:1V. As noted previously, the retrofit of FGD-A Pond with a composite liner system is underway. This liner system will prevent seepage into the embankment; therefore, the stability analysis for FGD-A is conservative.

FGD-B and FGD-C Ponds are both lined with a composite geomembrane/clay liner; therefore, no phreatic surface is expected to develop within the embankments. The groundwater level below the FGD-B Pond was assumed to be at 410 ft-msl. The groundwater level near the cross-section analyzed for FGD-C Pond was assumed to be at 410 ft-msl, which is representative of the eastern portion of the pond.

## 3.5 Seismic Loading

Based on the "US Seismic Hazard 2014 Map" prepared by the United States Geologic Survey (USGS) and the "2008 Interactive Deaggregations" (USGS), the peak ground acceleration (PGA) for a 2% probability of exceedance in 50 years (return period of 2,475 years) is 0.06g for the site location (including amplification factors for site soil conditions). A horizontal seismic load coefficient equal to the PGA was conservatively used in the pseudostatic analysis.

## 3.6 Liquefaction Potential

Soil liquefaction describes a phenomenon whereby a saturated or partially saturated soil substantially loses strength and stiffness in response to an applied stress, usually earthquake shaking or other sudden change in stress condition, causing it to behave like a liquid. The phenomenon is most often observed in saturated, loose (low density or uncompacted), sandy soils.

The embankment soils of ponds FGD-A, FGD-B, and FGD-C are all composed of clayey materials with significant fines content. The immediate foundation materials are also composed of soils containing a significant portion of fines and are as well considerable dense. The subsurface investigations performed at each of the ponds do not indicate any soils in the embankment or its foundation, which are susceptible to liquefaction. Hence, failure of the pond slopes due to liquefaction is considered unlikely for the CCR surface impoundments at the OGSES.

## 3.7 Stability Analysis Results

Slope stability analyses were performed for long-term conditions for each of the critical cross-sections considered under static and seismic loading conditions. Both interior and exterior slopes were analyzed for “Maximum Storage Pool” (2 feet of freeboard) and “Maximum Surcharge Pool” (no freeboard) conditions. The interior slopes were analyzed for the condition where the pond is empty.

The results of the slope stability analysis cases are presented in Table 5, Table 6, and Table 7 for ponds FGD-A, FGD-B, and FGD- C, respectively. The corresponding analysis outputs can be found in Appendix A. The results indicate that the pond slopes are sufficiently stable under all considered loading scenarios.

**Table 5: Slope Stability Analysis Results – FGD-A**

| Cross-Section | Case # | Slope Location | Pond Pool Level | Loading Condition | Required Safety Factor (1) | Calculated Safety Factor |
|---|---|---|---|---|---|---|
| A-A' | 1a | Exterior | Storage | Static | 1.50 | 1.89 |

| | 5b | | | Pseudostatic | 1.00 | 1.80 |

Note: (1) Required safety factors per §257.73(e)(i)-(iii)

# 4.0 CONCLUSIONS

Based on our review of the information provided by Oak Grove, on information prepared by Golder, and on our analyses, the calculated factors of safety through the critical cross sections in the surface exceed the values listed in § 257.73(e)(1)(i)-(iv).

## PROFESSIONAL CERTIFICATION

This document and all attachments were prepared by Pastor, Behling & Wheeler, LLC under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I hereby certify that the groundwater monitoring system installed at the referenced facility has been designed and constructed to meet the requirements of Section 257.91 of the CCR Rule.

Patrick J. Behling, P.E.
Principal Engineer
PASTOR, BEHLING & WHEELER, LLC

# 1.0 INTRODUCTION

Luminant Power (Luminant) operates the Oak Grove Steam Electric Station (OGSES) located approximately 10 miles north of Franklin, Robertson County, Texas (Figure 1). The OGSES consists of two 800-megawatt power generation units which burn lignite and coal. Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operations. Currently, CCRs generated at the OGSES are managed by Luminant in surface impoundments located on the OGSES property or the Ash Landfill 1. Two CCR units have been identified within the OGSES operations, the FGD Pond Area and the Ash Landfill 1. This report discusses the Ash Landfill 1 (the Site), which is located approximately 3,500 feet southwest of the OGSES power plant. The Ash Landfill 1 meets the definition of a CCR landfill and is subject to groundwater monitoring system requirements of the CCR Rule.

The CCR Rule (40 CFR 257 Subpart D - *Standards for the Receipt of Coal Combustion Residuals in Landfills and Surface Impoundments*) has been promulgated by the EPA to regulate the management and disposal of CCRs as solid waste under Resource Conservation and Recovery Act (RCRA) Subtitle D. The final CCR Rule was published in the Federal Register on April 17, 2015. The effective date of the CCR Rule was October 19, 2015.

The CCR Rule establishes national minimum criteria for existing and new CCR landfills, existing and new CCR surface impoundments, and lateral expansions to landfills/impoundments. Pastor, Behling & Wheeler, LLC (PBW) was retained by Luminant to evaluate and certify that the groundwater monitoring system at the Site in accordance with Section 257.91 of the CCR Rule.

## 1.1 Description of Ash Landfill 1

Ash Landfill 1 is located approximately 3,500 feet southwest of the OGSES power plant (Figure 2). CCRs generated at the OGSES, including fly ash and bottom ash, are transported and managed/disposed of by Luminant in the Ash Landfill 1. Cell 1 of the Ash Landfill 1 was constructed in 2009 and the landfill was expanded in 2011. The existing liner system for the Ash Landfill 1 includes a 60-mil high density polyethylene (HDPE) geomembrane and a 3-foot thick compacted clay liner (Golder, 2015).

LUMINANT

## 1.2 CCR Unit Groundwater Monitoring System Requirements

Section 257.91 of the CCR Rule indicates that existing CCR landfills and surface impoundments be provided with a groundwater monitoring system that consists of sufficient wells, installed at appropriate location and depths, to yield groundwater samples from the uppermost aquifer that meet the following criteria:

- Accurately represent the quality of background groundwater that has not been affected by leakage from a CCR unit; and
- Accurately represent the quality of groundwater passing the waste boundary of the CCR unit. The downgradient monitoring system must be installed at the waste boundary to ensure detection of groundwater contamination in the uppermost aquifer. All potential contaminant pathways must be monitored.

The specific configuration of the groundwater monitoring system must be determined based on site-specific technical information that must include aquifer thickness, groundwater flow rate, groundwater flow direction (including seasonal and temporal fluctuation in groundwater flow), saturated and unsaturated geologic units and fill materials that overly the uppermost aquifer, materials comprising the uppermost aquifer, and materials comprising the confining unit defining the lower boundary of the upmost aquifer, including, but not limited to, thickness, stratigraphy, lithology, hydraulic conductivities, porosities, and effective porosities.

LUMINANT

At a minimum, the monitoring system must consist of at least one upgradient and three downgradient monitoring wells, and any additional monitoring wells necessary to accurately represent the quality of the background groundwater that has not been affected by leakage from the CCR unit and the quality of groundwater passing the waste boundary of the CCR unit.

Monitoring wells must be cased in a manner that maintains the integrity of the monitoring well borehole. This casing must be screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples. The annular space above the sampling depth must be sealed to prevent contamination of samples and the groundwater. There must be documentation in the operating record of the design, installation, development, and decommissioning of any monitoring wells, piezometers and other measurement, sampling, and analytical devices. The qualified engineer must have access to and must review this documentation as part of the groundwater monitoring system certification.

# 2.0 GROUNDWATER MONITORING SYSTEM EVALUATION

## 2.1 Ash Landfill 1 Groundwater Monitoring System

The CCR groundwater monitoring well system at the Ash Landfill 1 consists of six monitoring wells (MW-02, MW-05, MW-07, MW-08R, MW-09, and AL-10) that are each screened in the uppermost aquifer at the Site. The locations of the CCR monitoring wells are shown on Figure 2. Well construction information and survey data for the CCR wells are summarized in Table 1, CCR monitoring well logs are presented in Appendix A, and photographs of the CCR wells are presented in Appendix B.

## 2.2 Local Geology and Hydrogeology

The Site is located in the outcrop area of the Eocene-aged Wilcox Group (Barnes, 1970). PBW reviewed historical soil boring logs, monitoring well completion documentation, and historical reports to describe the geologic and hydrogeologic conditions in the Ash Landfill 1. Geologic cross sections were constructed through the area using these data. The locations of the cross sections are presented on Figure 3 and the cross sections are presented on Figures 4 and 5.

Historical soil borings indicate the geology near the Ash Landfill 1 generally consists of relatively thick, interbedded sand and clay strata. The sand units in the Ash Landfill 1 Area are typically described as poorly sorted, silty to clayey sand with occasional zones of well sorted sand. The uppermost aquifer occurs under unconfined conditions within the shallow sand units at the Site.

LUMINANT

## 2.3 Groundwater Potentiometric Surface Elevations

Eight background groundwater monitoring events were performed using the Ash Landfill 1 CCR monitoring well system from October 2015 to April 2017. Static water levels measured during the background monitoring period indicated water elevations ranging from 406.96 feet above mean sea level (amsl) to 419.20 feet amsl, and depths to water ranging from 26.79 feet bgs to 50.38 feet bgs (Table 2). Groundwater potentiometric surface maps based on data collected during the background monitoring period are presented in Appendix C.

Groundwater elevations were generally highest to the southwest of the Ash Landfill 1 and lowest to the east of the Ash Landfill 1, with an inferred groundwater flow direction to the east. Based on the inferred groundwater flow direction, the location of each CCR monitoring well relative to Ash Landfill 1 is as

follows:

| Potential Upgradient Wells | Potential Downgradient Wells |
|---|---|
| MW-02 | MW-05 |
| AL-10 | MW-07 |
| | MW-08R |
| | MW-09 |

## 2.4 Uppermost Aquifer Hydraulic Conductivity Testing

PBW performed slug tests at monitoring wells MW-02, MW-05, and MW-09 on September 23, 2015 to evaluate groundwater linear flow velocities of the uppermost aquifer at the Site. Slug test data and time-head change plots used to calculate hydraulic conductivities and transmissivities of the uppermost aquifer are provided in Appendix D. A summary of these hydraulic properties is presented in Table 3. The average hydraulic conductivities for the wells ranged from $7.66 \times 10^{-3}$ cm/sec (well MW-09) to $2.74 \times 10^{-4}$ cm/sec (well MW-05), with a geometric mean for the test wells of $2.48 \times 10^{-3}$ cm/sec.

## 2.5 Conclusions

The CCR groundwater monitoring well system at the Ash Landfill 1 complies with Section 257.91 of the CCR Rule. This conclusion is supported by the following as described in detail in previous sections of this report:

- Six monitoring wells are included in the CCR groundwater monitoring system – two upgradient monitoring wells and four downgradient monitoring wells.
- Each monitoring well is screened in the uppermost aquifer at the Site. Samples collected from upgradient monitoring wells will be representative of the quality of background groundwater that has not been affected by leakage from the landfill and samples collected from downgradient wells will ensure detection of groundwater contamination in the uppermost aquifer from the landfill.
- The monitoring wells are constructed with appropriate well casing to maintain the integrity of the monitoring well borehole and with slotted well screens to enable collection of groundwater samples. In addition, the annular space above the well screen is appropriately sealed to prevent contamination of groundwater samples from surface sources.
- Appropriate documentation exists concerning the design, installation, and development of the monitoring wells.

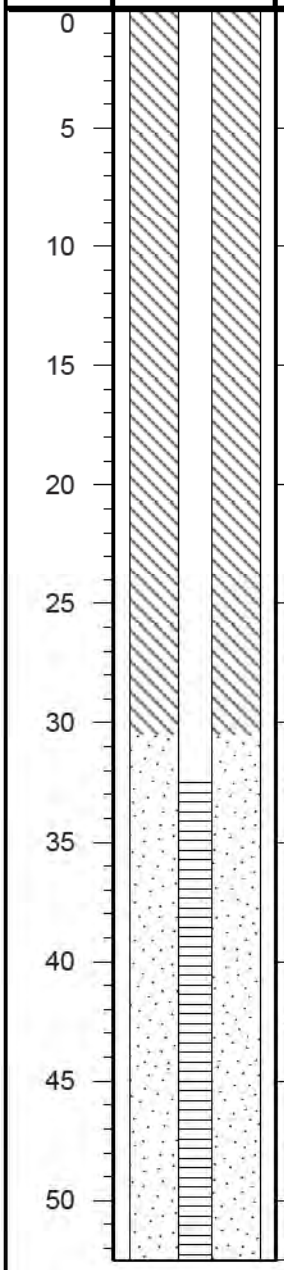
# Log of Boring: MW-8R

Oak Grove Steam Electric Station
Robertson County, TX

PBW Project No. 5164D

| | | | |
|---|---|---|---|
| Completion Date: | 11/9/2016 | Drilling Method: | HSA |
| Drilling Company: | Sunbelt Industrial Services | Borehole Diameter (in.): | 8.25 |
| Driller: | Juan R. Alcala | Total Depth (ft): | 52.5 |
| Driller's License: | 59430 | TOC Elevation (ft. AMSL): | 443.84 |
| Logged By: | Michelle Hermiston | Northing: | 570970 |
| Sampling Method: | 2.25" X 5' Split Spoon | Easting: | 3199809 |



| Lithologic Description |
|---|
| (0 - 3) Silty SAND, dark brown, abundant roots, very fine grained sand, unconsolidated, damp, gradational basal contact |
| (3 - 10.5) Silty CLAY, mottled gray, orange, and red, firm, very firm from 4.0' to 5.0', pieces of lignite present throughout, moderate plasticity, damp, sharp basal contact |
| (10.5 - 27.5) Sandy CLAY, laminated light gray and orange/brown, trace black laminations present, no to low plasticity, moderate plasticity at 17.5' to 27.5', higher sand content at 15.0' to 17.5', purplish gray clay lenses from 23.0' to 27.5', soft, firm to very firm from 17.5' to 27.5', damp, gradational basal contact |
| (27.5 - 52.5) Silty SAND, light gray, laminated dark gray and orange (28.5'-31.0', 38.0'-42.0'), unconsolidated, trace clay present, 0.25" thick clay lenses at 31.5', 37.5', and 41.0',dark brown/red around clay lense at 37.5', trace black laminae at 38.0' to 40.0', moist, wet at 35.0', interbedded dark brownish red and light gray sand and clay at 42.0' to 45.5', orange/brown from 45.5' to 50.0', gray with some orange staining from 50.0' to 52.5' |

## EXPLANATION

- CCR Monitoring Well Location
- (410.06) Groundwater Potentiometric Surface (ft. MSL)
- —400— Groundwater Potentiometric Surface Contour (C.I. = 2 ft.)

N

Scale in Feet

0 500 1000

SOURCE:
Imagery from Google Earth dated 10/30/2014.

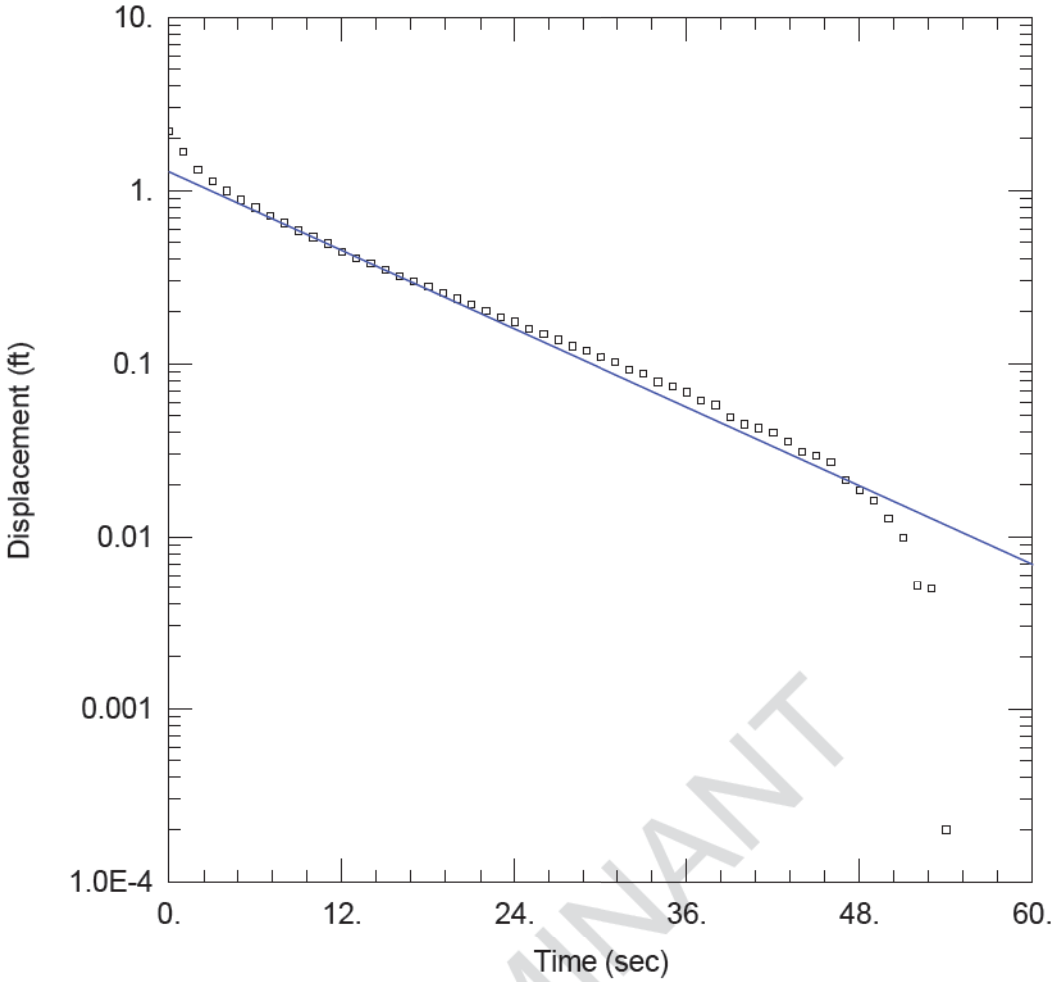
# Aquifer Test Data



LUMINANT

## WELL TEST ANALYSIS

Data Set: J:\...\MW-02 Slug OUT.aqt
Date: 01/18/16 Time: 17:05:57

## PROJECT INFORMATION

Company: PBW
Client: Luminant
Project: 5164-D
Location: OGSES
Test Well: MW-02
Test Date: 9-23-15

## AQUIFER DATA

Saturated Thickness: 19.74 ft Anisotropy Ratio (Kz/Kr): 1.

## WELL DATA (MW-02)

Initial Displacement: 2.2 ft
Total Well Penetration Depth: 19.74 ft
Casing Radius: 0.083 ft
Static Water Column Height: 19.74 ft
Screen Length: 19.74 ft
Well Radius: 0.39 ft
Gravel Pack Porosity: 0.2

## SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice

K = 0.007252 cm/sec y0 = 1.281 ft

Data Set: J:\5164 - Luminant CCR Well Installation and GW Sampling\5164-D_Oak Grove\OGSES Slug Tests Sept 201
Date: 01/18/16
Time: 17:06:12

## PROJECT INFORMATION

Company: PBW
Client: Luminant
Project: 5164-D
Location: OGSES
Test Date: 9-23-15
Test Well: MW-02

## AQUIFER DATA

Saturated Thickness: 19.74 ft
Anisotropy Ratio (Kz/Kr): 1.

## SLUG TEST WELL DATA

Test Well: MW-02

X Location: 0. ft
Y Location: 0. ft

Initial Displacement: 2.2 ft
Static Water Column Height: 19.74 ft
Casing Radius: 0.083 ft
Well Radius: 0.39 ft
Well Skin Radius: 0.39 ft
Screen Length: 19.74 ft
Total Well Penetration Depth: 19.74 ft
Corrected Casing Radius (Bouwer-Rice Method): 0.1896 ft
Gravel Pack Porosity: 0.2

No. of Observations: 55

LUMINANT

## SOLUTION

Slug Test
Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
ln(Re/rw): 3.004

## VISUAL ESTIMATION RESULTS

### Estimated Parameters

| Parameter | Estimate | |
|---|---|---|
| K | 0.007252 | cm/sec |
| y0 | 1.281 | ft |

T = K*b = 4.364 cm²/sec

## PROFESSIONAL CERTIFICATION

This document and all attachments were prepared by Pastor, Behling & Wheeler, LLC under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I hereby certify that the groundwater monitoring system installed at the referenced facility has been designed and constructed to meet the requirements of Section 257.91 of the CCR Rule.

Patrick J. Behling, P.E.

# 1.0 INTRODUCTION

Luminant Power (Luminant) operates the Oak Grove Steam Electric Station (OGSES) located approximately 10 miles north of Franklin, Robertson County, Texas (Figure 1). The OGSES consists of two 800-megawatt power generation units which burn lignite and coal (PBW, 2008a). Coal Combustion Residuals (CCR) including fly ash, bottom ash, and gypsum are generated as part of OGSES unit operations. Currently, CCRs generated at the OGSES are managed by Luminant in surface impoundments located on the OGSES property or the Ash Landfill 1. Two CCR units have been identified within the OGSES operations, the FGD Pond Area and the Ash Landfill 1. This report discusses the FGD Pond Area (the Site), which includes FGD-A Pond, FGD-B Pond, and FGD-C Pond. The FGD Ponds meet the definition of CCR surface impoundments and are subject to groundwater monitoring system requirements of the CCR Rule.

The CCR Rule (40 CFR 257 Subpart D - *Standards for the Receipt of Coal Combustion Residuals in Landfills and Surface Impoundments*) has been promulgated by the EPA to regulate the management and disposal of CCRs as solid waste under Resource Conservation and Recovery Act (RCRA) Subtitle D. The final CCR Rule was published in the Federal Register on April 17, 2015. The effective date of the CCR Rule was October 19, 2015.

LUMINANT

The CCR Rule establishes national minimum criteria for existing and new CCR landfills, existing and new CCR surface impoundments, and lateral expansions to landfills/impoundments. Pastor, Behling & Wheeler, LLC (PBW) was retained by Luminant to evaluate and certify that the groundwater monitoring system at the Site has been designed and constructed to meet the requirements of Section 257.91 of the CCR Rule.

## 1.1 Description of the FGD Ponds

The FGD-A Pond, FGD-B Pond, and FGD-C Pond (collectively referred to as the "FGD Ponds") are located approximately 2,500 feet northwest of the power generation units (Figure 2). FGD-A Pond was originally constructed in the mid-1980s during the initial facility construction phase. Plant and pond construction were halted in the 1980s prior to activation of the pond. OGSES construction began again in 2007 and an assessment of the pond's condition was conducted as part of the OGSES project. Two phases of pond assessment were conducted and it was determined that reconstruction was required to

bring the pond into compliance with Texas Commission on Environmental Quality (TCEQ) regulations. The FGD-A Pond was reconstructed by Fluor Enterprises, Inc., and is approximately 9.5 acres in size (PBW, 2008b). The FGD-A Pond contains combustion byproducts generated from the OGSES, which consists of fly ash, bottom ash, and gypsum/scrubber sludge. Other wastes, including but not limited to, low volume wastewaters and ash contact water which are periodically generated during OGSES operation and stored in the FGD-A Pond prior to treatment for recycling or disposal (PBW, 2008b). FGD-A is lined with a 3-foot thick compacted clay liner (Golder, 2015a).

The FGD-B Pond was originally constructed in the mid-1980s during the initial OGSES construction phase for use as a storm water retention pond. Plant and pond construction were halted in the 1980s prior to activation of the pond. The former retention pond was reconstructed in 2012 as FGD-B Pond to supplement the adjacent FGD-A Pond, and is approximately 12 acres in size. FGD-B Pond receives combustion byproducts generated from the OGSES similar to FGD-A Pond (PBW, 2011). FGD-B is lined with an approximately 3-foot thick compacted clay liner (Golder, 2015a).

FGD-C Pond construction commenced in June 2015 and was completed in 2016. FGD-C Pond is approximately 25 acres in size and used to manage flue gas desulfurization (FGD) system wastewater and scrubber sludge/gypsum from the OGSES. The pond is also used to manage lesser amounts of low volume wastewaters, ash contact water, metal cleaning wastewaters, and storm water runoff prior to treatment for recycling or disposal (Golder, 2015b).

LUMINANT

### 1.2 CCR Unit Groundwater Monitoring System Requirements

Section 257.91 of the CCR Rule indicates that existing CCR landfills and surface impoundments be provided with a groundwater monitoring system that consists of sufficient wells, installed at appropriate location and depths, to yield groundwater samples from the uppermost aquifer that meet the following criteria:

- Accurately represent the quality of background groundwater that has not been affected by leakage from a CCR unit; and
- Accurately represent the quality of groundwater passing the waste boundary of the CCR unit. The downgradient monitoring system must be installed at the waste boundary to ensure detection of groundwater contamination in the uppermost aquifer. All potential contaminant pathways must be monitored.

The specific configuration of the groundwater monitoring system must be determined based on site-specific technical information that must include aquifer thickness, groundwater flow rate, groundwater flow direction (including seasonal and temporal fluctuation in groundwater flow), saturated and unsaturated geologic units and fill materials that overly the uppermost aquifer, materials comprising the uppermost aquifer, and materials comprising the confining unit defining the lower boundary of the upmost aquifer, including, but not limited to, thickness, stratigraphy, lithology, hydraulic conductivities, porosities, and effective porosities.

At a minimum, the monitoring system must consist of at least one upgradient and three downgradient monitoring wells, and any additional monitoring wells necessary to accurately represent the quality of the background groundwater that has not been affected by leakage from the CCR unit and the quality of groundwater passing the waste boundary of the CCR unit. Multi-unit groundwater monitoring systems are allowed but must be equally as capable of detecting monitored constituents at the waste boundary of a CCR unit as individual groundwater monitoring wells.

Monitoring wells must be cased in a manner that maintains the integrity of the monitoring well borehole. This casing must be screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples. The annular space above the sampling depth must be sealed to prevent contamination of samples and the groundwater. There must be documentation in the operating record of the design, installation, development, and decommissionings of any monitoring wells, piezometers and other measurement, sampling, and analytical devices. The qualified engineer must have access to and must review this documentation as part of the groundwater monitoring system certification.

LUMINANT

# 2.0 GROUNDWATER MONITORING SYSTEM EVALUATION

## 2.1 FGD Ponds Groundwater Monitoring System

The CCR groundwater monitoring well system at the FGD Ponds consists of nine monitoring wells (FGD-1, FGD-2, FGD-3, FGD-4, FGD-5, FGD-6, FGD-8, FGD-11, and FGD-12) that are each screened in the uppermost aquifer at the Site. The locations of the CCR monitoring wells are shown on Figure 2. Well construction information and survey data for the CCR wells are summarized in Table 1, CCR monitoring well logs are presented in Appendix A, and photographs of the CCR wells are presented in Appendix B.

## 2.2 Local Geology and Hydrogeology

The FGD Ponds are located in the outcrop area of the Eocene-aged Wilcox Group (Barnes, 1970). PBW reviewed historical soil boring logs, monitoring well completion documentation, and historical reports to describe the geologic and hydrogeologic conditions in the FGD Pond Area. Geologic cross sections were constructed using these data. Cross section locations are presented on Figure 3 and the cross sections are presented on Figures 4, 5, and 6.

LUMINANT

Historical soil borings indicate the geology in the FGD Pond Area primarily consists of an upper zone of relatively thick, interbedded sand and clay strata and a lower zone of interbedded silty to clayey sand and well sorted sand. The uppermost aquifer at the Site occurs in the lower zone of interbedded silty to clayey sand.

## 2.3 Groundwater Potentiometric Surface Elevations

Eight background groundwater monitoring events were performed using the FGD Pond Area CCR monitoring well system from October 2015 to December 2016. Static water levels measured during the background monitoring period indicated water elevations ranging from 409.34 feet above mean sea level (amsl) to 431.61 feet amsl, and depths to water ranging from 13.25 feet bgs to 42.01 feet bgs (Table 2). Groundwater potentiometric surface maps based on data collected during the background monitoring period are presented in Appendix C.

Groundwater elevations were generally highest to the west of the FGD Pond Area and lowest to the east of the FGD Pond Area, with an inferred groundwater flow direction to the east. Based on the inferred

groundwater flow direction, the location of each CCR monitoring well relative to the FGD Ponds is as follows:

| Upgradient Wells | Downgradient Wells |
|---|---|
| FGD-8 | FGD-1 |
| FGD-11 | FGD-2 |
| | FGD-3 |
| | FGD-4 |
| | FGD-5 |
| | FGD-6 |
| | FGD-12 |

### 2.4 Uppermost Aquifer Hydraulic Conductivity Testing

PBW performed slug tests at monitoring wells FGD-5, FGD-11, and FGD-12 on September 23, 2015 to evaluate groundwater linear flow velocities of the uppermost aquifer at the Site. Slug test data and time-head change plots used to calculate hydraulic conductivities and transmissivities of the uppermost aquifer are provided in Appendix D. A summary of these hydraulic properties is presented in Table 3. The average hydraulic conductivities for the wells ranged from $2.48 \times 10^{-3}$ cm/sec (well FGD-12) to $9.07 \times 10^{-5}$ cm/sec (well FGD-11), with a geometric mean for the test wells of $4.19 \times 10^{-4}$ cm/sec.

LUMINANT

### 2.5 Conclusions

The CCR groundwater monitoring well system at the FGD Pond Area complies with Section 257.91 of the CCR Rule. This conclusion is supported by the following as described in detail in previous sections of this report:

- Nine monitoring wells are included in the CCR groundwater monitoring system – two upgradient monitoring wells and seven downgradient monitoring wells.
- Each monitoring well is screened in the uppermost aquifer at the Site. Samples collected from upgradient monitoring wells will be representative of the quality of background groundwater that has not been affected by leakage from the CCR units and samples collected from downgradient wells will ensure detection of groundwater contamination in the uppermost aquifer from the CCR units.
- The monitoring wells are constructed with appropriate well casing to maintain the integrity of the monitoring well borehole and with slotted well screens to enable collection of groundwater samples. In addition, the annular space above the well screen is appropriately sealed to prevent contamination of groundwater samples from surface sources.

- Appropriate documentation exists concerning the design, installation, and development of the monitoring wells.

Lithologic Description

FILL, silty clay, CL, brown, moist, soft to firm.

FILL, silty sand, SM, very pale brown, dry to moist, soft, very fine grained.

FILL, silty clay, CL, dark gray, moist, firm, crumbles easily, some sand layers.

SANDY, CLAY, CL, strong brown, moist, firm, laminated, very fine grained sand

SILTY CLAY, CL, dark gray, moist, firm, with sand laminae.

SILTY CLAY, CL, mottled gray and brown, moist, firm to hard, some sand laminae, some oxidized staining.

SAND, SP, dark gray, wet, very soft to soft, very fine grained, some silty laminae.

# Groundwater Potentiometric Surface Maps

LUMINANT

## EXPLANATION

- CCR Monitoring Well Location
- (410.06) Groundwater Potentiometric Surface (ft. MSL)
- —400— Groundwater Potentiometric Surface Contour (C.I. = 5 ft.)

Note:
423.76*-measurement appears erroneous based on subsequent measurements. Result was not used to construct potentiometric surface contours.

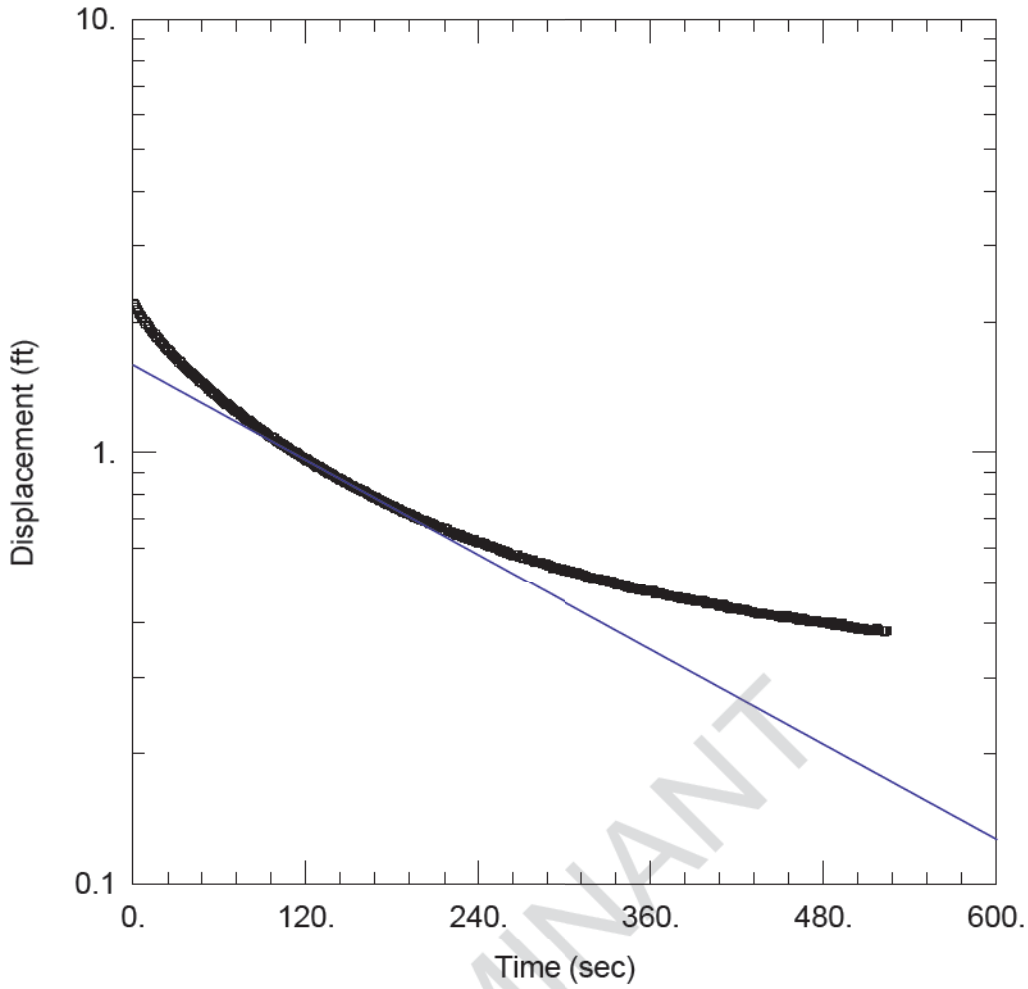
# Aquifer Test Data



LUMINANT

## WELL TEST ANALYSIS

Data Set: J:\...\FGD-5 Slug OUT.aqt
Date: 10/02/17 Time: 14:47:55

## PROJECT INFORMATION

Company: PBW
Client: Luminant
Project: 5164-D
Location: OGSES
Test Well: FGD-5
Test Date: 9-23-15

## AQUIFER DATA

Saturated Thickness: 12.65 ft Anisotropy Ratio (Kz/Kr): 1.

## WELL DATA (FGD-5)

Initial Displacement: 2.2 ft
Total Well Penetration Depth: 8.65 ft
Casing Radius: 0.083 ft
Static Water Column Height: 8.65 ft
Screen Length: 8.65 ft
Well Radius: 0.25 ft
Gravel Pack Porosity: 0.2

## SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
K = 0.0003194 cm/sec
y0 = 1.591 ft

Data Set: J:\5164 - Luminant CCR GW Monitoring\5164-D_Oak Grove\OGSES Slug Tests Sept 2015\Aqtesolv files
Date: 10/02/17
Time: 14:48:13

## PROJECT INFORMATION

Company: PBW
Client: Luminant
Project: 5164-D
Location: OGSES
Test Date: 9-23-15

## SOLUTION

Slug Test
Aquifer Model: Unconfined
Solution Method: Bouwer-Rice
ln(Re/rw): 2.387

## VISUAL ESTIMATION RESULTS

### Estimated Parameters

| Parameter | Estimate | |
|---|---|---|
| K | 0.0003194 | cm/sec |
| y0 | 1.591 | ft |

T = K*b = 0.1231 cm²/sec

## WELL TEST ANALYSIS

Data Set: J:\...\FGD-11 Slug OUT.aqt
Date: 01/18/16 Time: 16:57:34

## PROJECT INFORMATION

Company: PBW
Client: Luminant
Project: 5164-D
Location: OGSES
Test Well: FGD-11
Test Date: 9-23-15

## AQUIFER DATA

Saturated Thickness: 6.1 ft Anisotropy Ratio (Kz/Kr): 1.

## WELL DATA (FGD-11)

Initial Displacement: 2.2 ft Static Water Column Height: 6.1 ft
Total Well Penetration Depth: 6.1 ft Screen Length: 6.1 ft
Casing Radius: 0.083 ft Well Radius: 0.25 ft

## SOLUTION

Aquifer Model: Unconfined Solution Method: Bouwer-Rice
K = 9.068E-5 cm/sec y0 = 2.006 ft

Data Set: J:\5164 - Luminant CCR Well Installation and GW Sampling\5164-D_Oak Grove\OGSES Slug Tests Sept 201
