Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

Quantitative X-Ray Diffraction by Rietveld Refinement

Report Prepared for:	*WSP (Golder Associates Inc.)*
Project Number/ LIMS No.	*19465-04/MI7011-NOV22*
Sample Receipt:	*November 2, 2022*
Sample Analysis:	*February 16, 2023*
Reporting Date:	*September 7, 2023*

Instrument:	Panalytical X'pert Pro Diffractometer
Test Conditions:	Co radiation, 40 kV, 45 mA Regular Scanning: Step: 0.033°, Step time:0.15s, 2θ range: 5-80°
Interpretations :	PDF2/PDF4 powder diffraction databases issued by the International Center for Diffraction Data (ICDD). DiffracPlus Eva and Topas software.
Detection Limit :	0.5-2%. Strongly dependent on crystallinity.

Contents:

1) Method Summary
2) Quantitative XRD Results
3) XRD Pattern(s)

Landon Kapusianyk, B.Sc.
Mineralogist

Logan Jameson, M.Sc., P.Geo.
Senior Mineralogist

Method Summary

Mineral Identification and Interpretation:

Mineral identification and interpretation involves matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

Quantitative Rietveld Analysis:

Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

Re : TIMA Mineralogical Analysis of Soil Samples with supporting EMPA and LA-ICP-MS data focused on Lithium Determination.

This memo summarizes testwork completed by the mineralogy group at SGS Burnaby, BC, Canada, on five samples submitted by WSP. The objective of the testwork was to characterize the mineralogy of samples and determine if any minerals contain low levels of lithium (Li). The analysis was completed using a combination of TIMA-X (TESCAN Integrated Mineral Analyser), XRD analysis (X-Ray Diffraction), EMPA (Electron MicroProbe Analysis) and LA-ICP-MS (Laser Ablation Inductively Coupled Plasma Mass Spectrometry). The modal mineralogy and elemental compositions are reported.

The analysis indicated that the samples were primarily composed of quartz (37.7-61.9%), with the phase of interest being mixed clay/mica species (8.41-22.5%). Moderate abundance of plagioclase (8.12-11.1%) and minor amounts of K-feldspar. Carbonates of calcite and dolomite are present in abundance in two of the samples. The Li concentration within the mixed clay/mica ranged from 3.25 ppm to 502.9 ppm.

1. Sample Preparation

Five samples were provided for the project and submitted to SGS Mineralogy. The samples were received wet and were dried at 30 °C. Dry weight was taken and inventoried, and all information was entered into a Laboratory Information Management System (LIMS) with the assigned number MI7011-NOV22.

Head geochemical assay submission was done on a pulverized subsample. Assays conducted were major elements by Whole Rock Analysis (WRA), including chlorine (Cl) using fusion X-ray Fluorescence (XRF), total S by LECO and trace metals by multi-acid ICP-MS/OES for lithium (Li) and boron (B). A subsample of each sample was submitted for XRD analysis, and a further subsample was submitted to the SGS ARD department for 6-step Tessier Sequential Extraction, to include boron.

Three samples were selected for further mineralogy analysis by TIMA, with EMPA and LA-ICP-MS based on the clay/mica content and lithium values. These selected samples were (N-SB-04 (12-18), N-SB-02 (10-13), and N-SB-05 (10-16.6).

Each sample was de-agglomerated, stage-crushed to a P80 of 150 µm and micro-riffled to obtain a ~2-3 g subsample, which was used to prepare two polished sections per sample.

2. Tessier Leach

The summary of lithium results of the 6-step Tessier Leach test on all five samples. Measured and normalized are given below in Table 1 and Table 2, and the full elemental suite is shown in the results attached.

Table 1: Summary of the Lithium results from the 6-Step Tessier Leach Test

Element	Tessier Leach Step	Unit	N-SB-04 (12-18)	N-SB-04 (40-45)	N-SB-02 (10-13)	N-SB-05 (10-16.6)	N-SB-14 (50-52)

3. MINERALOGY

3.1. X-RAY DIFFRACTION ANALYSIS

The mineral identification and interpretation by XRD involved matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF). Quantitative Rietveld analysis is performed by using Topas 4.2 (Bruker AXS).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data and additional mineralogy. The primary mineral was quartz, with notable amounts of muscovite and montmorillonite.

Table 3: Summary of Rietveld Quantitative Analysis X-Ray Diffraction Results

Mineral/Compound	N-SB-04 (12-18) JAN7011-01 (wt %)	N-SB-04 (40-45) JAN7011-02 (wt %)	N-SB-02 (10-13) JAN7011-03 (wt %)	N-SB-05 (10-16.6) JAN7011-04 (wt %)	N-SB-14 (50-52) JAN7011-05 (wt %)

Montmorillonite	-	-	-	12.0	-
TOTAL	100	100	100	100	100

3.2. TIMA-X MINERALOGY (ALTERNATIVE AUTOMATED MINERALOGICAL ANALYSIS)

TIMA-X is an acronym for TESCAN Integrated Mineral Analyzer, and it is based on four Energy Dispersive X-ray (EDX) silicon drift detectors (SDD) attached to a TESCAN MIRA (field-emission gun – FEG) platform, which also includes a backscattered electron (BSE) and secondary electron (SE) detectors. The TIMA system utilizes both the EDX and BSE signals to identify minerals at each measurement point (or each homogenous segment of a grain, depending upon the analysis mode). It is optimized to deal with rapidly acquired low-count spectra. These EDX (and BSE) spectra (and BSE data) are compared to entries in a mineral library on a first-match principle to identify the mineral phase. The mineral library is based on theoretical mineral/phase composition or created by the user based on BSE, X-ray spectral windows counts and ratios.

High-Resolution Mapping (THRM), was the selected scan mode. The THRM collects a BSE signal and an X-ray spectrum at a set resolution (3 µm) to map the particles. It collects modal and textural information, such as liberation or exposure analysis of grains of interest.

Three samples were analyzed using TIMA-X for the project. The mineral abundances were determined and shown below in Table 4, with the data report attached. The mineral phase of interest would be mixed clays/micas. These were grouped due to the fine-grained and intergrown nature of the minerals. The abundance of mixed clays/micas ranged from 8.41 % to 22.5% and on average ~17.3%.

Table 4: Modal Mineralogy by TIMA-X (across three selected samples)

	Total	100.0	100.0	100.0

3.3. EMPA AND LA-ICP-MS

The polished sections for each sample were submitted for EMPA and LA-ICP-MS at the University of New Brunswick, Microscopy and Microanalysis Facility. Electron Microprobe Analysis (EMPA) with selected minerals of interest (clays and micas) were analyzed to quantify the chemical composition of the major and minor elements. It is well known that many minerals display compositional variations. Therefore, EPMA was necessary to determine the chemistry of the minerals and identify the minerals correctly. LA-ICP-MS was combined with the EPMA to determine the Li content in the clay-sized and mica minerals.

The EMPA data indicated that the lithium concentration across all three samples ranged from 3.25 ppm to 502.9 ppm and averaged at 70.5 ppm. Among the three samples, N-SB-04 (12.0-18.0) showed the highest average Li concentration of 93.3 ppm, followed by N-SB-02 (10-13) at 67.6 ppm and N-SB-05 (10-16.6) at 53.3 ppm.

4. Conclusion

Due to the trace lithium grades and the fine-grained nature of the micas present, gathering a high number of satisfactory elemental data points was challenging, with only 64 viable LA-ICP-MS points out of 126 points selected. The variability of lithium content of the clay/mica grains was notably large, along with mixed EMPA spectra. Only eight grains had a value greater than 100 ppm Li, although sample N-SB-04 (12.0-18.0) had one at 502.9 ppm at point g11. This sample contains muscovite, but due to the high Fe content, this high Li-bearing phase is suspected to be biotite (mica). Sample N-SB-05 (10-16.6) was the only sample to contain montmorillonite by XRD. That did not change the relative abundance of lithium within the samples compared to the muscovite-rich samples. To conclude, the LA-ICP-MS results, in conjunction with the TIMA data, indicated that the primary source of deleterious lithium was within the mixed clay/mica phases.

Refer to the official project report for extended TIMA, EMPA, and LA-ICP-MS data.

1. INTRODUCTION

Golder Associates, Inc. (Golder) retained SiREM to perform a laboratory treatability study to assess the adsorption and desorption behaviour of arsenic (As), boron (B), lithium (Li), and sulfate (SO_4^{2-}) in groundwater and geologic material from the Vistra Newton site in IL (the Site). The purpose of the study was to assess the sorption characteristics of As, B, Li, and SO_4^{2-} and generate site-specific sorption coefficients and further assess the stability of sorbed As, B, Li, and SO_4^{2-} under oxidizing, reducing, and alkaline conditions.

The geologic materials were collected by Golder personnel on 17-21 August 2021 and received by SiREM on 10 September 2021. The groundwater (APW-02, APW-04, APW-14, APW-05 and APW-05S) was collected by Golder personnel on 16 and 17 August 2021 and was received by SiREM on 23 August 2021. The groundwater samples were received outside of temperature at 19 degrees Celsius (°C). Therefore, the groundwater samples were re-collected on 31 August 2021 and received by SiREM on 2 September 2021 at 6 °C. The groundwater received on 2 September 2021 was the only groundwater used during the study. The materials received and chosen for the study are summarized in the Table below. The chain of custodies received with these samples are provided in Appendix A.

Test	Depth	Client ID (Sediment)	Client ID (Groundwater)
Adsorption	60.0'-67.1'	N-SB-05 (60.0'-67.1')	APW-04
	12.0'-18.0'	N-SB-04 (12.0'-18.0')	APW-14
Desorption	65.0'-71.5'	N-SB-02 (65.0'-71.5')	APW-05
	12.5'-20.0'	N-SB-02 (12.5'-20.0')	

The remainder of this report is divided into two sections. Section 2 presents the experimental materials and methods, and Section 3 presents the results.

2. MATERIALS AND METHODS

The following sections describe the materials and methods used for baseline sampling and homogenization (Section 2.1), adsorption test reactor construction and incubation (Section 2.2), desorption test reactor construction and incubation (Section 2.3), and study sampling and analysis (Section 2.4).

2.1 Baseline Sampling and Homogenization

2.1.1 Baseline Elemental and Mineralogy Sampling and Analysis

Site geologic material from all locations and depths were individually homogenized, and sub-sampled on 21 September 2021 for total metals and anions including As, B, Li, and SO_4^{2-}, total organic carbon (TOC), cation exchange capacity (CEC), X-ray diffraction (XRD), and loss on ignition (LOI) analyses, and on 1 March 2022 for synthetic precipitation leaching procedure (SPLP) for As, B, Li, and SO_4^{2-} (N-SB-XPW01 and N-SB-XPW04 only). Site groundwater was also sub-sampled on 21 September 2021 for analysis of dissolved metals and anions, dissolved organic carbon (DOC) and total dissolved solids (TDS).

Samples were collected in a temporary anaerobic glove bag filled with a 100 percent (%) nitrogen (N_2) headspace. After homogenization and sample collection the geologic material was removed from the anaerobic glove bag and stored at 4 ºC in N_2 purged polypropylene bags with minimized headspace until required for test set-up.

2.2 Adsorption Test Reactor Construction and Incubation

Adsorption test reactors were constructed in an anaerobic chamber (Coy Laboratory Products, Grass Lake, MI) filled with an atmosphere of approximately 80% N_2, 10% carbon dioxide (CO_2) and 10% hydrogen (H_2) (Linde Gases, Guelph, ON). H_2 in the anaerobic chamber functions to scavenge trace oxygen (O_2) via a palladium catalyst. Anaerobic conditions in the anaerobic chamber were verified using an indicator containing resazurin (Sigma, St. Louis, MO) in a mineral medium which turns pink in the presence of O_2. APW-04 groundwater and N-SB-05 (60.0'-67.1') geologic material was used to construct the first set of reactors. The second set of reactors were constructed using APW-14 groundwater with N-SB-04 (12.0'-18.0') geologic material. For both sets of reactors, geologic material was added on 14 February 2022 (Day -1) and the groundwater was spiked with As, B, Li, and SO_4^{2-} on 15 February 2022 (Day 0) and subsequently added to the reactors.

Reactors were constructed by filling sterile 125 milliliter (mL) (nominal volume), and 250 mL (nominal volume) Nalgene® bottles (Systems Plus, New Hamburg, ON) with a specified mass of geologic material and groundwater. The geologic material to groundwater (GM:GW) ratios tested in each set of reactors were 2:1, 1:1, 1:5, 1:10, and 1:20, based on the wet weight of the geologic material. Groundwater only controls were also constructed for each set.

In consultation with Golder, it was determined that the starting aqueous concentrations of As, B, Li, and SO_4^{2-} in the groundwater should be 200 micrograms per liter (µg/L), 10 milligrams per liter (mg/L), 300 µg/L, and 774 mg/L, respectively. The concentrations of all species were not at the target concentrations, therefore immediately before construction of the reactors, the entire volume of groundwater needed to construct each set of reactors was spiked with respective solutions prepared from the appropriate salt as detailed in the table below to target these concentrations in the aqueous phase of the reactors at the start of the adsorption test. Spiking occurred on 15 February 2022 (Day 0).

Compound	Target (mg/L)	Salt Used to Prepare Spiking Solution	Chemical Formula
Arsenic	0.2	Metaarsenite	$NaAsO_2$
Boron	10	Boric Acid	H_3BO_3
Lithium	0.3	Lithium Chloride	LiCl
Sulfate	774	Sodium Sulfate	Na_2SO_4

After construction, the reactors were incubated in the anaerobic chamber for a period of 7 days. During incubation the reactors were inverted once a day to increase the contact between the geologic material and groundwater. During quiescent incubation all reactors were covered to minimize photodegradation and incubated at 22 °C (room temperature). Table 1 details the

reactor construction, incubation, amendments, and sampling parameters of the adsorption test reactors.

2.3 Desorption Test Reactor Construction and Incubation

Desorption test reactors were constructed in an anaerobic chamber filled with an atmosphere of approximately 80% N_2, 10% CO_2 and 10% H_2 on 21 March 2022 (Day 0). The APW-05 groundwater and N-SB-02 (65.0'-71.5') geologic material was used to construct the first set of reactors. The second set of reactors was constructed using APW-05 groundwater with N-SB-02 (12.5'-20.0') geologic material.

Reactors were constructed by filling sterile 125 mL (nominal volume) Nalgene® bottles with a specified mass of geologic material and groundwater. Based on the adsorption test results, the GM:GW ratio (based on the wet weight of geologic material) was selected to be 1:10 in both sets of reactors.

After construction, all reactors were incubated for a period of 7 days. The control reactors for each set were tested under ambient conditions in the anaerobic glove chamber with no amendments throughout the incubation period. Treatment reactors for each set were tested under highly reducing and highly oxidizing conditions. These conditions were established in the reactors through daily amendments of either H_2 or O_2, respectively. The H_2 sparged reactors were kept in the anaerobic glove chamber throughout the incubation period, whereas the O_2 sparged reactors were transferred out of the glove chamber and incubated on the lab bench under aerobic conditions.

During the incubation period, reactors were inverted once a day to increase the contact between the geologic material and groundwater. During quiescent incubation all reactors were covered to minimize photodegradation and incubated at 22 °C (room temperature). Table 2 details the reactor construction, incubation, amendments, and sampling parameters of the desorption test reactors.

2.4 Sampling and Analysis

2.4.1 Baseline and Reactor Sampling

Site geologic materials were sub-sampled for baseline analysis of total metals, CEC, TOC, XRD, and LOI on 21 September 2021. Site materials N-SB-XPW01 (10.0'-12.7') and N-SB-XPW04 (10.0'-15.0') were further sub-sampled for baseline analysis of SPLP on 1 March 2022. Site groundwater was sub-sampled for baseline analysis of dissolved metals including As, B, Li and SO_4^{2-}, DOC, and TDS on 21 September 2021.

The adsorption and desorption control reactors were sampled on Day 0 and Day 7 of their incubation periods. Treatment test reactors from both tests were sampled on Day 7. Samples from the adsorption and desorption tests were submitted for analysis of pH, oxidation reduction potential (ORP), anions (including total volatile fatty acids [VFAs], chloride, nitrite-N, nitrate-N, SO_4^{2-}, and phosphate) and dissolved metals. The controls from the desorption test were additionally submitted for TDS on Day 0.

Site geologic material sub-samples were collected in 250 mL wide-mouth amber glass jars and shipped on ice to ALS Environmental in Waterloo, ON (ALS) or SGS Environmental in Lakefield, ON (SGS). Site groundwater and test reactor samples submitted for pH, ORP, TDS and anions analysis were collected using 30 mL plastic syringes (Fisher Scientific, Whitby, ON) and analysed by SiREM. Samples submitted for dissolved metals were collected as described in Section 2.4.6 and shipped on ice to ALS or SGS for analysis.

2.4.2 Analysis of pH

The pH measurements were performed using an Oakton pH spear with a combination pH electrode (Oakton, Vernon Hills, IL). A 0.5 mL sample was collected (as described in section 2.4.1), placed into a 1.5 mL micro-centrifuge tube, and measured on the lab bench. The pH spear was calibrated at each sampling event according to the manufacturer's instructions using pH 4.0, 7.0 and 10 standards.

2.4.3 Analysis of ORP

The ORP measurements were performed using a YSI Multilab IDS Meter with YSI 4210 ORP glass electrode (Mandel Scientific, Guelph, ON). A 1.2 mL sample was collected (as described in section 2.4.1) and placed in a 5 mL Thermo-Fisher vial. The vial was removed from the glove box and the ORP was measured on the lab bench. The ORP probe was tested at each sampling event according to the manufacturer's instructions using Zobell's solution.

2.4.4 Analysis of TDS

The TDS measurements were performed using a combination conductivity and TDS meter (Hach Model 44600, CO). A 1.5 mL sample was collected (as described in section 2.4.1) and placed in a 5 mL Thermo-Fisher vial. The vial was removed from the glove box and the TDS was measured on the lab bench.

2.4.5 Analysis of Anions and Total VFAs

Anion and total VFA analysis was performed on a Thermo-Fisher ICS-2100 ion chromatograph (IC) equipped with a Thermo-Fisher AS-DV autosampler and an AS18 column. An isocratic separation was performed using 33 millimolar (mM) reagent grade sodium hydroxide eluent generator cartridge (EGC) (Thermo Scientific, Burlington, ON) eluent for 13 minutes (min). One standard was analysed with each set of samples tested to verify the seven-point calibration using external standards of known concentrations. External standards were prepared gravimetrically using chemicals of the highest purity available (Sigma St Louis, MO or Bioshop, Burlington, ON). Data was integrated using Chromeleon 7® Chromatography software (Thermo-Fisher, Burlington, ON). The quantitation limits (QLs) were as follows: 0.07 mg/L total VFAs, 0.07 mg/L chloride, 0.09 mg/L nitrite, 0.09 mg/L nitrate, 0.07 mg/L SO_4^{2-}, 0.07 mg/L phosphate and 0.08 mg/L bromide. The total VFAs value was initially calibrated as lactate, but includes lactate, formate, acetate, propionate, pyruvate, and butyrate.

A 0.5 mL sample was withdrawn from the reactors (as described in section 2.4.1), after which the sample was placed in a 1.5 mL micro-centrifuge tube. Samples were centrifuged for 5 min at

13,000 revolutions per minute (RPM) to remove solids. The supernatant was sub-sampled, diluted 50-fold in deionized (DI) water and placed in a Thermo-Fisher auto sampler vial with a cap that filters the sample during automated injection onto the IC through a 25 microliter (µL) sample loop.

2.4.6 Analysis of Groundwater at ALS and SGS

Dissolved metals and DOC analyses were completed at both ALS and SGS.

Dissolved metals analysis was completed using an inductively coupled plasma-mass spectrometer (ICP-MS). DOC analysis was completed using a modified version of ASTM 1915-13, method E. Reactor samples were collected by decanting the sample into a 30 mL plastic syringe (Fisher Scientific, Whitby, ON) and filtering the sample with a 0.45 micrometer (µm) syringe filter into a 30 mL high-density polyethylene (HDPE) bottle with 150 µL of nitric acid preservative. The samples were then packaged and shipped to ALS or SGS for analysis.

Baseline groundwater samples were submitted to SGS in Lakefield, ON for analysis. However, due to delays in reporting times that SGS could not improve, the analytical laboratory used to complete the dissolved metals analysis for the adsorption and desorption tests was changed to ALS in Waterloo, ON, which could meet the reporting timelines required for the study. Analyses at both labs were completed using similar ICP-MS methodologies.

All groundwater laboratory reports are presented in Appendix B.

2.4.7 Analysis of Geologic Material at ALS and SGS

Total metals and TOC analyses were completed using an acid digestion based on Environmental Protection Agency (EPA) method 3050B, followed by ICP-MS analysis of the extract based on Standard Method 5310C. The total metals and TOC reports from SGS are presented in Appendix C.

CEC analysis was completed using a custom direct method developed by SGS. The CEC report from SGS is presented in Appendix D.

XRD analysis was completed using a custom X-ray crystallography method developed by SGS. LOI analysis was completed using a temperature-controlled furnace along with a crucible to determine the mass prior and post ignition. The XRD and LOI report from SGS is presented in Appendix E.

SPLP analysis was completed using an extract produced by the synthetic precipitation leaching procedure as per EPA 1312 is analysed by Collision/Reaction Cell ICPMS. The extract is filtered through a 0.6-to-0.8-micron glass fibre filter. The SPLP report from ALS is presented in Appendix F.

3. RESULTS

Tables 3, 4, 5, 6 and 7 present a summary of baseline groundwater dissolved metals and DOC results, a summary of baseline geologic material total metals and TOC results, a summary of baseline geologic material CEC results, a summary of baseline geologic material XRD and LOI results, and a summary of baseline geologic material SPLP results.

Tables 8, 9, and 10 present the dissolved metals, anions, and pH and ORP results from the Adsorption Tests.

Table 11 presents the calculated site-specific sorption coefficients for As, B, Li, and SO_4^{2-}. Three types of sorption coefficient were calculated for each analyte in each material combination based on the results from the adsorption tests: a linear coefficient, a Langmuir coefficient, and a Freundlich coefficient. The calculations used to prepare the sorption coefficients are presented in Appendix G.

Tables 12, 13, and 14 present the dissolved metals, anions, and pH, ORP, and TDS results from the Desorption Tests.

Dissolved metals, DOC, TDS, and anion results are reported in units of mg/L. Total metals results are reported in units of micrograms per gram (µg/g). CEC results are presented as milliequivalents per 100 grams of soil (meq/100g). Total SO_4^{2-}, TOC, XRD, and LOI results are presented as a percentage of the total composition of the material. SPLP results are reported in units of µg/L. ORP results are reported in units of millivolts (mV).

TABLES

TABLE 1: SUMMARY OF ADSORPTION TEST REACTOR CONTROLS, TREATMENTS, AND AMENDMENTS

Vistra Newton, IL Site

Groundwater Sample ID	Geologic Material Sample ID	Treatment	Description	Number of Replicates	Incubation Period and Sampling Frequency	Microcosm Content						Number of Analyses

Amended with 11.32 mL of a 10 g/L H_3BO_3 solution to target a 10 mg/L B concentration on Day 0.	Amended with 3.39 mL of a 1 g/L LiCl solution to target a 0.3 mg/L Li concentration on Day 0.	Amended with 12.20 mL of a 100 g/L Na_2SO_4 solution to target a 774 mg/L SO_4^{2-} concentration on Day 0.	2	2	2
		1:5 Soil:Water Ratio	Geologic Material and Water in a 1:5 ratio, shaken once daily during incubation	2		0.100	0.020	Amended with 344.72 µL of a 2 g/L As(III) solution to target a 0.2 mg/L As concentration on Day 0.	Amended with 11.32 mL of a 10 g/L H_3BO_3 solution to target a 10 mg/L B concentration on Day 0.	Amended with 3.39 mL of a 1 g/L LiCl solution to target a 0.3 mg/L Li concentration on Day 0.	Amended with 12.20 mL of a 100 g/L Na_2SO_4 solution to target a 774 mg/L SO_4^{2-} concentration on Day 0.	2	2	2
		1:10 Soil:Water Ratio	Geologic Material and Water in a 1:10 ratio, shaken once daily during incubation	2		0.100	0.010	Amended with 344.72 µL of a 2 g/L As(III) solution to target a 0.2 mg/L As concentration on Day 0.	Amended with 11.32 mL of a 10 g/L H_3BO_3 solution to target a 10 mg/L B concentration on Day 0.	Amended with 3.39 mL of a 1 g/L LiCl solution to target a 0.3 mg/L Li concentration on Day 0.	Amended with 12.20 mL of a 100 g/L Na_2SO_4 solution to target a 774 mg/L SO_4^{2-} concentration on Day 0.	2	2	2
		1:20 Soil:Water Ratio	Geologic Material and Water in a 1:20 ratio, shaken once daily during incubation	2		0.100	0.004	Amended with 344.72 µL of a 2 g/L As(III) solution to target a 0.2 mg/L As concentration on Day 0.	Amended with 11.32 mL of a 10 g/L H_3BO_3 solution to target a 10 mg/L B concentration on Day 0.	Amended with 3.39 mL of a 1 g/L LiCl solution to target a 0.3 mg/L Li concentration on Day 0.	Amended with 12.20 mL of a 100 g/L Na_2SO_4 solution to target a 774 mg/L SO_4^{2-} concentration on Day 0.	2	2	2

*Numbers in brackets represent additional control reactors required for analytical sample volumes.

Notes:

µL - microliter
As - arsenic
B- boron
Cl - chloride
g/L - grams per liter
H - hydrogen
ID - identification
kg - kilogram
L - liter
Li - lithium
mg/L - milligrams per liter
Na - sodium
O - oxygen
ORP - oxidation-reduction potential
$SO4^{2-}$ - sulfate

TABLE 2: SUMMARY OF DESORPTION TEST REACTOR CONTROLS, TREATMENTS, AND AMENDMENTS
Vistra Newton, IL Site

Groundwater Sample ID	Geologic Material Sample ID	Treatment	Description	Number of Replicates	Incubation Period and Sampling Frequency	Microcosm Contents		Amendments		Number of Analyses		
						Groundwater (L)	Saturated Geologic Material (kg)	Oxygen Gas	Hydrogen Gas	Dissolved Metals	Anions	pH/ORP
APW-05	N-SB-02 (65.0'-71.5')	Ambiant Control	Incubated under anaerobic conditions and shaken once daily during incubation	2 (2)*	7 Days (Sampled on Day 0 and 7)	0.1	0.02	--	--	2	2	2
		Oxidizing Conditions	Daily oxygen gas addition and incubated under aerobic conditions and shaken once daily during incubation	2	7 Days (Sampled on Day 7)	0.1	0.02	Amended with 5 mL of pure oxygen gas every day.	--	2	2	2
		Reducing Conditions	Daily hydrogen gas addition and incubated under anaerobic conditions and shaken once daily during incubation	2		0.1	0.02	--	Amended with 5 mL of pure hydrogen gas every day.	2	2	2
	N-SB-02 (12.5'-20.0')	Ambiant Control	Incubated under anaerobic conditions and shaken once daily during incubation	2 (2)*	7 Days (Sampled on Day 0 and 7)	0.1	0.02	--	--	2	2	2
		Oxidizing Conditions	Daily oxygen gas addition and incubated under aerobic conditions and shaken once daily during incubation	2	7 Days (Sampled on Day 7)	0.1	0.02	Amended with 5 mL of pure oxygen gas every day.	--	2	2	2
		Reducing Conditions	Daily hydrogen gas addition and incubated under anaerobic conditions and shaken once daily during incubation	2		0.1	0.02	--	Amended with 5 mL of pure hydrogen gas every day.	2	2	2

*Numbers in brackets represent additional control reactors required for analytical sample volumes.

Notes:

ID - identification
kg - kilogram
L - liter
mL - milliliters
ORP - oxidation-reduction potential

TABLE 3: SUMMARY OF BASELINE GROUNDWATER TOTAL DISSOLVED METALS, DOC and TDS RESULTS

Vistra Newton, IL Site

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Arsenic (As)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Boron (B)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Lithium (Li)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Silicon (Si)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2686539-1, -2, -3, -4
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2686539-1, -2, -3, -4

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-D-CCMS-WT	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Matrix Spike	Barium (Ba)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Boron (B)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Boron (B)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Iron (Fe)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Lithium (Li)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Lithium (Li)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Potassium (K)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Silicon (Si)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Silicon (Si)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfur (S)-Dissolved	MS-B	L2688199-21, -22, -23, -24
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2688199-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -20, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Uranium (U)-Dissolved	MS-B	L2688199-21, -22, -23, -24

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-D-CCMS-WT	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analysis conducted in accordance with the Protocol for Analytical Methods Used in the Assessment of Properties under Part XV.1 of the Environmental Protection Act (July 1, 2011).

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Reference Information

Chain of Custody Numbers:

1 2

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Workorder: L2688199 Report Date: 28-FEB-22

Client: SIREM
130 Stone Road West
Guelph ON N1G 3Z2
Contact: Michael Healey

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Sampler	: Rachel Hallman		
Site	: ----		
Quote number	: 2022 SOA		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Greg Pokocky	Supervisor - Inorganic	Metals, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*

Sampler	: Rachel Hallman		
Site	: ----		
Quote number	: 2022 SOA		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Dissolved Metals in Water by CRC ICPMS	E421	439609	1	4	25.0	5.0	✓
Laboratory Control Samples (LCS)							
Dissolved Metals in Water by CRC ICPMS	E421	439609	1	4	25.0	5.0	✓
Method Blanks (MB)							
Dissolved Metals in Water by CRC ICPMS	E421	439609	1	4	25.0	5.0	✓
Matrix Spikes (MS)							
Dissolved Metals in Water by CRC ICPMS	E421	439609	1	4	25.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Waterloo - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Waterloo - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percent Difference (RPD) and Data Quality Objectives
- Matrix Spike (MS) Report; Recovery and Data Quality Objectives
- Method Blank (MB) Report; Recovery and Data Quality Objectives
- Laboratory Control Sample (LCS) Report; Recovery and Data Quality Objectives

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Service number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percent Difference
# = Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test-specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Turnaround Time (TAT) Requested

☑ Routine [R] if received by 3pm M-F - no surcharges apply
☐ 4 day [P4] if received by 3pm M-F - 20% rush surcharge minimum
☐ 3 day [P3] if received by 3pm M-F - 25% rush surcharge minimum
☐ 2 day [P2] if received by 3pm M-F - 50% rush surcharge minimum
☐ 1 day [E] if received by 3pm M-F - 100% rush surcharge minimum
☐ Same day [E2] if received by 10am M-S - 200% rush surcharge.

Additional fees may apply to rush requests on weekends, statutory holidays and for non-routine tests.

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm am/pm

For all tests with rush TATs requested, please contact your AM to confirm availability.

APPENDIX E:
SGS Geologic Material XRD and LOI Laboratory Report

Quantitative X-Ray Diffraction by Rietveld Refinement

Report Prepared for:	*Environmental Services*
Project Number/ LIMS No.	*Custom XRD/MI4503-OCT21*
Sample Receipt:	*October 4, 2021*
Sample Analysis:	*October 8, 2021*
Reporting Date:	*November 2, 2021*

Instrument:	BRUKER AXS D8 Advance Diffractometer
Test Conditions:	Co radiation, 35 kV, 40 mA Regular Scanning: Step: 0.02°, Step time: 1s, 2θ range: 3-80°
Interpretations :	PDF2/PDF4 powder diffraction databases issued by the International Center for Diffraction Data (ICDD). DiffracPlus Eva and Topas software.
Detection Limit :	0.5-2%. Strongly dependent on crystallinity.

Contents:

1) Method Summary
2) Quantitative XRD Results
3) XRD Pattern(s)

Kim Gibbs, H.B.Sc., P.Geo.
Senior Mineralogist

Huyun Zhou, Ph.D., P.Geo.
Senior Mineralogist

ACCREDITATION: SGS Minerals Services Lakefield is accredited to the requirements of ISO/IEC 17025 for specific tests as listed on our scope of accreditation, including geochemical, mineralogical and trade mineral tests. To view a list of the accredited methods, please visit the following website and search SGS Canada - Minerals Services - Lakefield: http://palcan.scc.ca/SpecsSearch/GLSearchForm.do.

Method Summary

The Rietveld Method of Mineral Identification by XRD (ME-LR-MIN-MET-MN-D05) method used by SGS Minerals Services is accredited to the requirements of ISO/IEC 17025.

Mineral Identification and Interpretation:

Mineral identification and interpretation involves matching the diffraction pattern of an unknown material to patterns of single-phase reference materials. The reference patterns are compiled by the Joint Committee on Powder Diffraction Standards - International Center for Diffraction Data (JCPDS-ICDD) database and released on software as Powder Diffraction Files (PDF).

Interpretations do not reflect the presence of non-crystalline and/or amorphous compounds, except when internal standards have been added by request. Mineral proportions may be strongly influenced by crystallinity, crystal structure and preferred orientations. Mineral or compound identification and quantitative analysis results should be accompanied by supporting chemical assay data or other additional tests.

Quantitative Rietveld Analysis:

Quantitative Rietveld Analysis is performed by using Topas 4.2 (Bruker AXS), a graphics based profile analysis program built around a non-linear least squares fitting system, to determine the amount of different phases present in a multicomponent sample. Whole pattern analyses are predicated by the fact that the X-ray diffraction pattern is a total sum of both instrumental and specimen factors. Unlike other peak intensity-based methods, the Rietveld method uses a least squares approach to refine a theoretical line profile until it matches the obtained experimental patterns.

Rietveld refinement is completed with a set of minerals specifically identified for the sample. Zero values indicate that the mineral was included in the refinement calculations, but the calculated concentration was less than 0.05wt%. Minerals not identified by the analyst are not included in refinement calculations for specific samples and are indicated with a dash.

DISCLAIMER: This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted.

TOTAL	100	100	100	100	100	100	100	100	100	100

Zero values indicate that the mineral was included in the refinement, but the calculated concentration is below a measurable value.

Dashes indicate that the mineral was not identified by the analyst and not included in the refinement calculation for the sample.

The weight percent quantities indicated have been normalized to a sum of 100%. The quantity of amorphous material has not been determined.

Mineral List

Mineral/Compound	Formula
Quartz	SiO_2

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
LEACH-MSPLP-WT	Waste	Modified SPLP Extraction	E9003

A Sample (100g) of soil is leached for 18 +/- 2 hours with 2.0 liters of splp leaching fluid #2 (pH = 5). For the analysis of metals, the leachate is filtered through a 0.45um filter using a metals free filtering system prior to digestion and analysis.

MET-SPLP-WT	Waste	SPLP Leachable Metals	EPA 200.8

An extract produced by the Synthetic Precipitation Leaching Procedure (SPLP) as per EPA 1312 or Ontario MECP E9003 is analyzed by Collision/Reaction Cell ICPMS. The extract is filtered through a 0.6 to 0.8 micron glass fibre filter for Method 1312 or through a 0.45um filter for Method E9003.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

APPENDIX G:
Sorption Coefficient Calculations

The site-specific sorption coefficients (linear, Langmuir, and Freundlich) presented Table 11 were calculated as follows below.

To calculate the site-specific sorption coefficients, the equilibrium concentrations of each analyte in the groundwater and geologic material must be known. Equilibrium aqueous concentrations were measured directly after the reaction period. Equilibrium geologic material concentrations were calculated using the baseline geologic material concentrations, the time zero aqueous concentrations and the equilibrium aqueous concentrations as follows:

$$q_e = \frac{q_{t=0} \cdot m_s + (C_{t=0} - C_e) \cdot v_{aq}}{m_s}$$

Where,

q_e is the concentration of a given analyte in the geologic material in g/kg at equilibrium

$q_{t=0}$ is the concentration of a given analyte in the geologic material in g/kg at baseline

C_e is the concentration of a given analyte in the aqueous phase in g/L at equilibrium

$C_{t=0}$ is the concentration of a given analyte in the aqueous phase in g/L at the start of the reaction period, after spiking

m_s is the dry mass of the geologic material in a given reactor, in kg

v_{aq} is the volume of groundwater in a given reactor, in L

Linear Sorption Coefficient:

The concentration of a given analyte in the geologic material is plotted against the concentration of the analyte in the aqueous phase. The slope of the linear trendline is the linear sorption coefficient (K_D).

$$q_e = C_e \cdot K_D + b$$

Where,

q_e is the concentration of a given analyte in the geologic material in g/kg at equilibrium

C_e is the concentration of a given analyte in the aqueous phase in g/L at equilibrium

K_D is the linear sorption coefficient

b is the y-intercept of the plot

Langmuir Sorption Coefficient:

The Langmuir model of sorption can be expressed as follows:

$$q_e = \frac{q_m \cdot K_L \cdot C_e}{1 + K_L \cdot C_e}$$

Where,

q_e is the concentration of a given analyte in the geologic material in g/kg

C_e is the concentration of a given analyte in the aqueous phase in g/L

K_L is the Langmuir sorption coefficient

q_m is the maximum concentration possible to be sorbed to the geologic material in g/kg

This relationship can be linearized as follows:

$$\frac{C_e}{q_e} = \frac{1}{K_L \cdot q_m} + \frac{C_e}{q_m}$$

Therefore, the equilibrium aqueous phase concentration divided by the equilibrium geologic material concentration (C_e/q_e) can be plotted against the equilibrium aqueous phase concentration (C_e) and:

$$K_L = \frac{1}{y - intercept \cdot q_m}$$

$$q_m = \frac{1}{slope}$$

Freundlich Sorption Coefficient

The Freundlich model of sorption can be expressed as follows:

$$q_e = K_F \cdot (C_e)^{\frac{1}{n}}$$

Where,

q_e is the concentration of a given analyte in the geologic material in g/kg

C_e is the concentration of a given analyte in the aqueous phase in g/L

K_F is the Freundlich sorption coefficient

n is a Site-specific sorption constant

This relationship can be linearized as follows:

$$\log q_e = \frac{\log K_F + 1}{n \cdot \log C_e}$$

Therefore, the logarithm of the equilibrium geologic material concentration ($\log(q_e)$) can be plotted against the logarithm of the equilibrium aqueous phase concentration ($\log(C_e)$) and:

$$K_F = e^{intercept}$$

$$n = \frac{1}{slope}$$

1. INTRODUCTION

Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.650(d)(1) requires the owner or operator of a coal combustion residuals (CCR) surface impoundment (SI) to characterize the nature and extent of a release and relevant site conditions that may affect the remedy ultimately selected for a CCR SI if any constituent regulated under 35 I.A.C. § 845 is found to exceed the groundwater protection standard (GWPS). A report documenting the nature and extent of constituents detected above the GWPS that are attributable to the Newton Power Plant (NPP) Primary Ash Pond (PAP) was prepared and submitted to the Illinois Environmental Protection Agency (IEPA) dated April 3, 2024 [1]. Additional investigation to further characterize the nature and extent as described in the Nature and Extent Report was collected in June 2024 following the submittal of the Report.

The additional investigation included the following (**Figure 1-1**):

- Installation and development of two monitoring wells (APW19S and APW20S) downgradient of APW02, to further define the nature and extent of lithium, sulfate and total dissolved solids (TDS)
- Installation and development of one monitoring well pair (APW23 and APW23S) downgradient of APW04, to define the nature and extent of sulfate in the uppermost aquifer (UA), and sulfate and TDS in the Upper Drift (UD)
- Installation and development of two monitoring wells (APW21S and APW22S) west and northeast of APW05S to define the nature and extent of sulfate and TDS in the UD
- Collection of soil samples from the screened interval of each additional well and from the material just above the screen interval to characterize soils that interact with groundwater in support of groundwater polishing evaluations.

Documentation of site investigation activities described above and other well maintenance activities performed during the June 2024 field work is included as **Appendix A.** Groundwater elevations were measured and samples were collected following installation of the wells. This report supplements the existing Nature and Extent Report with the results from the additional investigation and initial groundwater monitoring completed in 2024.

2. ADDITIONAL INVESTIGATION RESULTS

2.1 Geology

As previously described in the Nature and Extent Report [1], materials at the site have been categorized into five hydrostratigraphic units at the PAP based on stratigraphic relationships, geologic composition, and common hydrogeologic properties. The units, listed from surface downward, are summarized as follows:

- **Upper Drift (UD)/Potential Migration Pathway (PMP):** The UD is composed of the low permeability silts and clays of the Peoria Silt and Sangamon Soil and the sandier soils of the Hagarstown Member (*i.e.,* PMP).
  - **Hagarstown Member/PMP:** The Hagarstown Member consists of discontinuous sandier deposits of the UD, where present, and overlies the Vandalia Till.
- **Upper Confining Unit (UCU):** This unit consists of the low permeability clay and silt of the Vandalia Till Member (Vandalia Till).
- **Uppermost Aquifer (UA):** This unit is composed of the Mulberry Grove Formation, which has been classified onsite as poorly graded sand, silty sand, clayey sand, and gravel.
- **Lower Confining Unit (LCU):** This unit is comprised of low permeability silt and clay of the Smithboro Till Member (Smithboro Till) and the Banner Formation.
- **Bedrock Unit:** Shale bedrock of the Pennsylvanian-age Mattoon Formation was encountered at the NPP during recent and historical investigations. Measured bedrock elevations indicate the bedrock surface is highest in the southeast [2].

CCR consists of fly and bottom ash within the PAP and may be present from the surface (approximately 545 to 555 feet[1]) to a minimum elevation of approximately 485 feet. CCR material is lowest in elevation along a historic drainage feature that runs approximately through the center of the PAP.

Borings and monitoring wells installed to further define the nature and extent of exceedances[2] (**Figure 1-1**, APW19S – APW23S and APW23; nature and extent wells) indicate consistent geologic materials and stratigraphic relationships. The Nature and Extent wells encountered the following units:

Upper Drift (UD)/Potential Migration Pathway (PMP): The UD was encountered in all borings advanced in 2024. PMP deposits were identified in APW19S, APW21S, and APW22S.

Upper Confining Unit (UCU): All borings were advanced to the UCU below the UD or PMP materials, while monitoring well APW23 penetrated the entire thickness of the UCU (26 feet, **Appendix A**).

[1] All elevations in this report are referenced to North American Vertical Datum of 1988 (NAVD88) unless otherwise noted.
[2] Throughout this document, "exceedance" or "exceedances" is intended to refer only to potential exceedances of proposed applicable background statistics or GWPSs as described in the proposed groundwater monitoring program, which was submitted to the IEPA on October 25, 2021 as part of IPGC's operating permit application for the NPP PAP. That operating permit application, including the proposed groundwater monitoring program, remains under review by the IEPA and, therefore, IPGC has not identified any actual exceedances.

Uppermost Aquifer (UA): The UA was encountered at a depth of 34.5 feet below ground surface (bgs) in APW23 (elevation ~481 feet) and was approximately 7 feet thick, which is consistent with previous borings advanced in the vicinity of APW23 [1].

Lower Confining Unit (LCU): The LCU was encountered at a depth of 41.5 ft bgs (elevation ~474 feet) in APW23, which is also consistent with the Nature and Extent Report.

2.2 Hydrogeology

Groundwater elevations and flow directions within in the UD/PMP are consistent with historical measurements occurring at elevations between approximately 410 and 440 feet. Based on the October 2024 measurements, groundwater within the UD/PMP flows from the northern portion of the PAP to the southeast toward APW12, and southwest towards G105 (**Figure 2-1**).

Consistent with previous reporting [1] groundwater flow in the UA is generally from the north near background wells APW05 and APW06 to the southwest toward a historic drainage feature and southeast toward Newton Lake. Specifically, groundwater flow is north to south beneath the center of the PAP (from APW05/APW06 toward APW09/APW15). Beneath the western portion of the PAP, flow is west to southwest converging towards a former surface drainage feature located west of the PAP (**Figure 2-2**) and an area where the UA is lowest in elevation and has the highest hydraulic conductivity. Beneath the eastern portion of the PAP, groundwater flows east to southeast (from APW05 toward APW11-APW14, and APW23).

Vertical gradients measured between wells APW23S and APW23 are downward which is consistent with those reported in the Nature and Extent Report [1].

3. UPDATES TO THE OCCURRENCE AND DISTRIBUTION OF GROUNDWATER EXCEEDANCES (EXTENT)

Field sampling forms and laboratory reports for additional sampling containing groundwater data from additional sampling locations are presented in **Appendix B** (laboratory reports from sampling the existing monitoring network are posted quarterly[3]). A summary of all exceedance parameters is provided in **Table 3-1** and groundwater data at exceedance locations is summarized in **Table 3-2.** As discussed in the Nature and Extent Report, an alternative source demonstration (ASD) was completed for the chloride exceedance at UA monitoring well APW15. The IEPA did not concur with the ASD. The non-concurrence was appealed, and the Illinois Pollution Control Board (IPCB) granted a stay on January 18, 2024. The nature and extent of chloride concentrations in the UA are not included in this report.

3.1 Extent in the Uppermost Aquifer

The Nature and Extent Report [1] identified only sulfate at well APW10 as an exceedance in the UA. No additional exceedances have been determined in the UA since submittal of that report. Monitoring well APW23, installed in 2024, has been sampled twice and the sulfate results were compared directly to the GWPS to determine whether an exceedance is present. Based on these initial results, there are no exceedances at APW23.

3.1.1 Sulfate

Sulfate exceedances in the UA continue to be limited to APW10. The extent of concentrations above the GWPS are defined laterally in the UA to the southwest by monitoring well APW13 and the recently installed APW23 (**Figure 3-1**). As discussed in the Nature and Extent Report, the UA is not present northeast of APW10, and exceedances are not expected to extend a significant distance in this direction due to the groundwater flow directions and the absence of UA materials observed at APW12. Newton Lake is located approximately 100 feet downgradient of APW10 and comparison of water elevations indicates that groundwater migrates toward Newton Lake. The extent of sulfate is defined downgradient by surface water samples collected near APW10 (Appendix A of the Nature and Extent Report [1] to which this addendum is attached), which indicate concentrations of sulfate are 39 milligrams per liter (mg/L), which are comparable to concentrations measured for sulfate in ambient portions of the lake distant from the PAP.

Downward migration of sulfate in the UA at APW10 is inhibited by the underlying Smithboro Till, which has a thickness of greater than 10 feet and vertical conductivity less than 2.7×10^{-7} centimeters per second (cm/s). This is very low relative to the horizontal hydraulic conductivity measured within APW10 (5.5×10^{-4} cm/s). The significant contrast in permeability (greater than two orders of magnitude) indicates groundwater will preferentially migrate horizontally toward Newton Lake and the elevated sulfate concentrations will not extend into the underlying till and shale bedrock.

3.2 Extents in Upper Drift /Potential Migration Pathways

Exceedances reported for the UD/PMP in the Nature and Extent Report included the following constituents and locations:

[3] https://www.luminant.com/ccr/illinois-ccr/?dir=il-ccr%2FNewton

- Sulfate – APW02, APW04, and APW05S
- Lithium – APW02
- TDS – APW02, APW04, and APW05S

Additional exceedances either detected during compliance monitoring since the submittal of the Nature and Extent Report or from samples collected from Nature and Extent monitoring wells installed in 2024 resulted in the following additional exceedances:

- Sulfate – APW19S, APW20S, APW21S, APW22S, and APW23S
- Lithium – APW19S
- TDS – APW12, APW19S, APW22S, and APW23S

The exceedances are summarized in **Table 3-1,** and groundwater data is summarized in **Table 3-2.**

3.2.1 Sulfate

Concentrations of sulfate measured in UD/PMP compliance wells, and the additional wells added to define the nature and extent, exceed the GWPS (400 mg/L) at APW02, APW04, APW05S, APW19S, APW20S, APW21S, APW22S, and APW23S (**Figure 3-2**). Monitoring wells APW19S through APW23S, installed in 2024, have only one or two sample events so individual sulfate results have been compared directly to the GWPS to determine whether the concentration exceeds at those locations.

NE wells installed to define exceedances provided additional information about sulfate distribution in the UD/PMP, although it did not fully bound the extent of sulfate in the UD/PMP. However, the extent is still ultimately defined by Newton Lake as described in the Nature and Extent Report to which this addendum is attached [1]. Notably, the concentrations of sulfate in the Nature and Extent wells are generally lower than the nearby compliance wells, except at APW23S. Concentrations of sulfate at APW23S (1,240 and 1,370 mg/L) are higher than those measured at APW04 (760 to 990 mg/L). In instances where concentrations are lower as distance from the unit increases, these observations provide some evidence for attenuation of sulfate concentrations.

The presence of elevated sulfate concentrations north of APW05S observed at APW22S, which is also located upgradient of APW05S (**Figure 2-1),** indicates that there may be another source of sulfate to the UD/PMP unit. Additional evaluation is ongoing to evaluate the potential source of sulfate concentrations in this area of the NPP.

3.2.2 Lithium

Concentrations of lithium exceed the GWPS (0.04 mg/L) in monitoring well APW02 and APW19S, located near the southwest corner of the PAP (**Figure 3-2**). To the west, the extent of lithium exceedances in groundwater is defined by APW20S and the downgradient extent of lithium concentrations near APW19S is limited by Newton Lake. As discussed in the Nature and Extent Report [1], concentrations of lithium were not detected in Newton Lake near this location.

3.2.3 Total Dissolved Solids

Concentrations of TDS measured in UD/PMP compliance wells, and the additional wells added to define the nature and extent, exceed the GWPS (400 mg/L) at APW02, APW04, APW05S, APW12,

APW19S, APW22S, and APW23S (**Figure 3-2**). Typically, major ions (such as sulfate) represent the primary contributors to TDS. TDS exceedances are coincident with sulfate exceedances at all wells with the exception of APW12. The extent of TDS exceedances near APW02 was further defined to the west by the addition of APW20S, which did not observe elevated TDS concentrations. TDS concentrations were also further delineated to the west of APW05S by APW21S which observed concentrations below the GWPS.

4. UPDATES TO THE GEOCHEMICAL CONCEPTUAL SITE MODEL (NATURE)

A geochemical conceptual site model (GCSM) was developed to describe the conditions of the groundwater in the vicinity of the NPP PAP and is summarized here (full analysis originally presented in Appendix C of the Nature and Extent report to which this addendum is attached). The GCSM describes the geochemical processes that contribute to the mobilization, distribution, and attenuation of chemicals in the environment. Only parameters that have exceeded the GWPS in PAP groundwater and to be addressed in the corrective action plan are included in the GCSM. As discussed in previous sections, the exceedances discussed herein include sulfate, TDS, and lithium. The effects of additional observed exceedances (*i.e.*, TDS at APW12) and additional and ongoing data collection on the GCSM are described below.

4.1 Solids Characterization

Table 4-1 serves as an update to Table 3-1 in the original GCSM document and summarizes boring identifiers and collection depths; adjacent groundwater monitoring well names, used in this section to refer to the solid phase samples for easier comparison with groundwater results; and methods of analysis. Analyses of samples collected as part of the Nature and Extent investigation included cation exchange capacity (CEC), loss on ignition (LOI), sequential extraction procedure (SEP), and X-ray diffraction (XRD) (method details provided in Section 3.1 of the original GCSM document). All laboratory reports for additional solids phase characterization are presented in **Appendix C**.

Table 4-2 summarizes the CEC, LOI, and SEP analysis results most relevant to the GCSM. The CEC of the additional investigation samples collected were similar to previous results in both UD and UA samples. The LOI of the additional UD investigation samples were higher than the values previously reported for UD samples. The additional investigation SEP results (analyzed by Eurofins) are compared to the SEP results previously generated by Eurofins for consistency (see Section 3.1 of the original GCSM document for details regarding SEP analytical methods). The aluminum and iron SEP results for the additional investigation samples were similar to those measured previously, although a few individual samples exhibited higher or lower concentrations. The lithium SEP results for the additional UA sample were consistent with previous results. The lithium SEP results for the additional investigation UD samples were largely consistent with previous results, with the exception of the metal hydroxide and organic fractions: higher lithium concentrations were associated with the metal hydroxide fraction and lower concentrations were associated with the organic fraction in the additional UD samples relative to previous results. This may indicate that lithium mobility within the UD has somewhat more dependence on redox conditions than previously assessed.

Similar to previous results[4], XRD of the additional investigation samples showed abundant carbonate minerals (*i.e.*, calcite and dolomite), tectosilicate minerals (*i.e.*, feldspars), and phyllosilicate minerals (*i.e.*, mica, chlorite/vermiculite, and kaolinite) (**Figure 4-1**). The phyllosilicate minerals, also known as clay-forming minerals, were typically more abundant in the clay size fraction than in the whole sample. The measurement of chlorite/vermiculite, K-feldspar, and kaolinite are particularly relevant to understanding the potential for lithium attenuation at

[4] The precise parameters of the XRD scan can favor the detection of certain minerals. To better understand the role of clay minerals at the site, different analytical parameters were used in the additional investigation analysis. Therefore, results to previous XRD results are qualitative.

the site. Kaolinite is the secondary clay formed from K-feldspar weathering or from chemical alteration of chlorite/vermiculite. Incorporation into actively forming kaolinite secondary clays (or pre-crystalline precursors) strongly retains lithium in aquifers (*e.g.*, [3] [4]), and this binding can be 60 percent (%) to 90% irreversible under changing geochemical conditions (*e.g.*, [5] [6] [7]). The occurrence of both kaolinite and its parent minerals suggests that actively forming kaolinite may be a sink for lithium at the site.

4.2 Aqueous Characterization

As described in **Section 3.2**, a TDS exceedance was observed at APW12. Similar to other UD/PMP locations with TDS exceedances, the dominant contributor to TDS at APW12 is sulfate. Geochemical data from APW12 are presented in the original GCSM document figures and tables. These data are consistent with the other UD/PMP locations that have sulfate-driven TDS exceedances. Therefore, the existing GCSM is applicable to the TDS exceedance at APW12.

Major controls on chemical fate and transport include pH, oxidation reduction potential, iron, and manganese. The data collected from the additional investigation wells are largely consistent with previous observations (**Figure 4-2**). One exception is manganese at 22S, which is an order of magnitude higher than at any other location.

The CCR materials are the primary source of constituent loading to the CCR porewater. Over an extended period (*e.g.*, months to years), the CCR porewater (*i.e.*, water contained within the interstitial pore spaces of the CCR that can be sampled by low-flow groundwater sampling methods) reaches equilibrium with the CCR materials. The porewater is therefore representative of the mobile phase constituents capable of migrating into the underlying materials and potentially downgradient in groundwater [8]. The GCSM proposed that the 1:2 correlation between sulfate and sodium in porewater, which largely persists into groundwater, suggests that a source of sodium sulfate to the CCR porewater is the primary source of sulfate to the groundwater. **Figure 4-3** shows the correlation between sulfate and sodium including data from the additional investigation locations. The additional investigation results plot with the other UD samples slightly above the 1:2 line, consistent with the GCSM observation that sulfate is primarily from the unit but there may be a secondary geogenic source of sulfate. One exception is APW21S, which has higher sulfate than expected given the sodium concentration. This may indicate a different source of sulfate contributing to the groundwater signature at APW21S.

Figure 4-4 shows a Piper diagram with the most recent three samples from all locations. The overall signature (main diamond of the plot) of the additional investigation samples is consistent with other wells in the same hydrostratigraphic unit. Relative to other locations with elevated sulfate in the same hydrostratigraphic unit, the anion signature at APW22S indicates a more chloride-dominant signature, and the cation signature at APW21S a more calcium-dominant signature.

4.3 GCSM Conclusions

The additional investigation into the nature and extent of the exceedances at NEW PAP found solid phase and aqueous results largely consistent with the existing GCSM. Additional mineralogical data indicates kaolinite formation from weathering at the site, providing additional support for lithium immobilization in the solid phase. Differences of note include a greater proportion of lithium associated with metal hydroxides in the solid phase than previously

assessed, and distinct groundwater signatures at APW21S and APW22S. The groundwater signatures at APW21S and APW22S suggest influence from sources other than the NEW PAP.

The GCSM includes two hydrostratigraphic units: the shallow UD/PMP and the deeper UA. The UA is shallowest (*i.e.*, in closest proximity to the upper drift/primary migration pathway) on the east side of the PAP. Groundwater in the UD/PMP and eastern UA wells tend to be geochemically similar: groundwater from these locations tends to be more oxidizing, exhibit lower pH, and have a cation signature dominated by calcium and magnesium. Groundwater in the rest of the UA tends to be more reducing (exhibiting higher dissolved iron concentrations), have higher pH, and have a greater contribution of sodium and potassium to the cation signature. These results suggest some degree of hydraulic connection between the UD/PMP and UA east of the PAP.

Sulfate is the major contributor to TDS in the PAP groundwater. Therefore, processes that control sulfate concentrations also control TDS. Elevated sulfate concentrations were observed in shallow groundwater wells (screened in the upper drift/primary migration pathway) and UA wells located east of the PMP. Sulfate in CCR porewater and the UD/PMP groundwater is correlated with sodium, indicating that dissolution of sodium sulfate from the CCR material is the primary source of sulfate to the CCR porewater. Sulfate exceedances in the UA, which occur exclusively on the east side of the PAP, are consistent with water migration from the UD/PMP. Potential sulfate attenuation mechanisms at the NPP PAP include sorption to solid-phase iron oxides. Based on results from laboratory batch testing, sulfate sorption may be more likely in the UA.

Lithium concentrations in groundwater are highest in UD/PMP and eastern UA groundwater. Although lithium was identified in solid samples located both upgradient and downgradient of the PAP, the similar distributions of lithium and sulfate suggest that CCR porewater is the primary source of lithium to the groundwater. The difference in groundwater lithium concentrations may be due to variability in porewater concentration or in attenuation to aquifer solids. Lithium in groundwater may be attenuated by sorption to exchangeable sites (readily reversible) or incorporation in clay mineral matrices (poorly reversible). Poorly reversible sorption of lithium to aquifer solids is supported by the occurrence of both the secondary clay kaolinite and its parent minerals (suggesting active formation) and laboratory batch testing results.

5. COMBINED GEOCHEMICAL AND HYDROGEOLOGIC CONCEPTUAL SITE MODELS

5.1 Sulfate and TDS Conceptual Site Model

The conceptual site model (CSM) describing current conditions at the PAP combining the hydrogeologic and geochemical CSMs for sulfate and TDS remain largely unchanged from the Nature and Extent Report. Porewater (*i.e.*, water contained within the interstitial pore spaces of the CCR that can be sampled by low-flow groundwater sampling methods) containing elevated concentrations of sulfate mixes with groundwater of the UD. Groundwater within the UD/PMP in the vicinity of the PAP travels horizontally outward from the PAP, ultimately migrating toward Newton Lake, or vertically into the clay of the UCU that separates the UD from the UA. Sulfate concentrations are attenuated physically through dilution and dispersion; and may be geochemically attenuated by sorption to iron oxides. The limit of sulfate exceedances is defined by wells in the UA with concentrations below the GWPS and Newton Lake, where sulfate concentrations near APW10 are low. The sulfate concentrations in Newton Lake were evaluated and they do not present unacceptable risk [9]. Sulfate exceedances of the GWPS have been observed in eight of 10 UD wells and one of 14 UA wells. The presence or absence of exceedances can be attributed to variability in both sulfate concentration within the CCR of the PAP and the extent of water migration between the UD/PMP and UA. Water quality signatures at upgradient UD wells APW21S and APW22S suggest an influence other than the PAP.

5.2 Lithium Conceptual Site Model

The CSM describing current conditions at the PAP combining the hydrogeologic and geochemical CSMs for lithium is as follows. Surface water within the PAP comes into contact with CCR and once it enters the pore spaces within the CCR we characterize it as porewater within the unlined CCR unit. Porewater containing elevated concentrations of lithium mixes with groundwater of the UD/PMP. Groundwater within the UD in the vicinity of the PAP travels horizontally outward from the PAP, ultimately migrating toward Newton Lake, or vertically into the clay of the UCU that separates the UD from the UA. Lithium concentrations are attenuated physically through dilution and dispersion and geochemically attenuated by sorption to and incorporation into clay minerals. The lithium exceedances are limited to the UD wells at the southwest corner of the unit (APW02 and APW19S) and are bounded in extent by lower concentrations at APW20S to the west and Newton Lake, where concentrations in surface water were less than 0.02 mg/L. The lithium concentrations in Newton Lake were evaluated and they do not present unacceptable risk [9]. Lithium exceedances of the GWPS observed in UD wells APW02 and APW19S are only located along the western side of the PAP, which is the same side of the PAP where the highest concentrations of lithium were observed in porewater (XPW01), indicating exceedances may be a result of proximity to portions of the PAP where CCR porewater contains relatively higher concentrations of lithium.

6. CONCLUSIONS AND FUTURE ACTIVITIES

In accordance with 35 I.A.C. § 845.650(d)(1), the nature and extent of GWPS exceedances of sulfate, TDS, and lithium have been described in sufficient detail to support a complete and accurate assessment of the corrective measures necessary to effectively clean up all releases from the PAP.

The lateral extents of exceedances are illustrated in **Figures 3-1 and 3-2**. Sulfate was selected for modeling source control presented in the Final Closure Plan and was identified as a surrogate for the exceedances of lithium and TDS, as described in the Groundwater Modeling Report[5]. For modeling purposes, it was assumed that sulfate would not significantly sorb or chemically react with aquifer solids (soil adsorption coefficient was set to 0 milliliters per gram), which is a conservative estimate for predicting contaminant transport times in the model. Additional geochemical modeling was completed to evaluate how sorption to solid phases may affect sulfate and lithium mobility and therefore the time to reach the GWPS for these parameters.[6]

INTRODUCTION

This Technical Memorandum (Tech Memo) for Newton Power Plant (NPP) was prepared by Ramboll America's Engineering Solutions, Inc. (Ramboll) for Illinois Power Generating Company This Tech Memo documents the monitoring network maintenance performed in June 2024 pursuant to the following document:

- *Proposal for Nature and Extent Investigation and Repairs and Improvements at Select Monitoring Wells, Newton Power Plant* (Proposal; Ramboll, 2024).

OBJECTIVES

The objectives of the field event were to: (1) install and develop two monitoring wells (APW19S and APW20S) downgradient of APW02, one monitoring well pair (APW23 and APW23S) downgradient of APW04, and two monitoring wells (APW21S and APW22S) downgradient of APW05S to meet the requirements of Title 35 of the Illinois Administrative Code (35 I.A.C.) § 845.650(d)(1); (2) collect soil samples from each new monitoring wells respective screen interval and from the soils just above the screen interval to characterize soils that interact with groundwater in support of groundwater polishing evaluations; (3) perform maintenance at select monitoring well locations, including installation of protective bollards and replacement of concrete well pads.

Based on observations made during a site visit on May 9, 2024 and confirmed during field activities, Ramboll made the following adjustments to the original scope of work:

- The location for the proposed monitoring well pair east of APW04 was inaccessible and the wells could not be installed due to the steepness of the slopes and thickness of vegetation in the area.
- Locations and scope of well improvements and repairs were adjusted in the field based on observations of Ramboll field staff. Notes of the adjustments are provided in this memorandum.

SITE WORK ACTIVITIES

At the request of Vistra, Ramboll oversaw completion of the on-site work activities on June 17 through June 28, 2024 in accordance with Ramboll's Proposal (Ramboll, 2024). Well installation and well improvement and repair work were performed by Cascade Drilling (Cascade) with oversight from Ramboll.

The following sections discuss site work methods and documentation of completed work.

UTILITY CLEARANCE

Prior to drilling Ground Penetrating Radar Systems (GPRS) utilized a ground penetrating radar antenna to scan a 10-foot radius around the proposed well locations and well improvement and repair locations.

Ramboll completed a subsurface clearance checklist, confirming all locations requiring intrusive work were cleared by GPRS and safe for ground disturbance.

MONITORING WELL INSTALLATION

Cascade utilized a Geoprobe 8140LS Mini Sonic drill rig equipped with a 6-inch diameter core barrel to advance borings for monitoring wells APW19S, APW20S, APW21S, APW22S, APW23, and AWP23S to to their final depths as directed by Ramboll field staff.

The soil lithology was logged continuously using the Unified Soil Classification System (USCS). The boring logs are provided in **Attachment A**. Based on observations in the field, soil samples from each boring location were collected by Ramboll for laboratory analysis from within the screened interval of each well and from the soil just above the screen interval as summarized in **Table A**. Soil samples were submitted by Ramboll for total metals by 7-step sequential extraction procedure, bulk mineralogy and clay mineralogy by x-ray diffraction, loss on ignition, and cation exchange capacity.

Table A. Soil Sample Collection Summary

Well Location	Top of Sample Interval (feet bgs)	Bottom of Sample Interval (feet bgs)	General Lithology
APW19S	7.5	8.2	Sand
APW19S	16	18	Sandy Clay
APW20S	14	16	Silty Clay
APW20S	20	22	Silty Clay
APW21S	8	10	Sand
APW21S	14	16	Sand
APW22S	9	11	Silty Clay
APW22S	20.5	22	Sand
APW23	37	39	Sand
APW23S	12	16	Silty Clay

bgs = below ground surface

The monitoring wells were constructed using 2-inch diameter schedule 40 polyvinyl chloride (PVC) casing and installed with a 10-foot PVC screen with a slot diameter of 0.010-inches. Filter sand was placed in the annular space surrounding the PVC extending to approximately two feet above the PVC screen. The annular space was sealed with 3/8-inch bentonite chips to at least two feet above the filter pack and the remaining annular space sealed with either 3/8-inch bentonite chips or cement-bentonite grout to surface. At each well a steel protective stick-up was installed to approximately three feet above the ground surface and set in a concrete pad extending horizontally approximately two feet by two feet and approximately 12 inches below ground surface (bgs). In addition, four 3.5-inch diameter concrete-filled steel bollards were installed around each well. Well construction logs are provided in **Attachment B**.

The monitoring wells were temporarily identified on the exterior of the protective cover until permanent identification markers are installed at each location. The soil boring and monitoring well construction

activities were completed on June 20, 2024. **Attachment C** includes a photographic log of the soil boring and monitoring well installation. The locations of the monitoring wells are depicted on **Figure 1**. The monitoring wells were surveyed by IngenAE, LLC in September 2024.

Each of the monitoring wells was developed twice following installation of the wells over the two week field event by Cascade and Ramboll using a pump and surge technique. The wells were surged and pumped until the purge water from the wells was clear or the wells went dry a minimum of three times during each development event. The volume of water removed and the depth to water in the wells before and after development are recorded on the well development logs provided in **Attachment D**.

MONITORING WELL IMPROVEMENT AND REPAIR TASKS

3.5-inch diameter, four or six-foot-tall concrete filled bollards were installed at 14 locations that had fewer than three bollards present or where existing bollards were in poor condition and needed to be replaced. Locations were identified in need of repair from the investigation performed by Ramboll in the spring of 2023 and modified based on updated observations during site work. **Attachment E** includes a photographic log of bollard installation. The number of bollards installed at each location is summarized in **Table B**. All surface seal debris and replaced bollards were disposed of on-site at the direction of plant personnel.

The protective cover and concrete surface pad was replaced at one location (A207) and the concrete surface pad was replaced at one location (G113) as summarized in **Table C**. In addition, the well pad at G139 was repaired by adding concrete to it to increase stability of the pad.

At monitoring well A207, a skid-steer was utilized to lift the protective cover vertically and remove it without disturbing the PVC well casing. The existing concrete surface pad was removed utilizing a skid-steer with a jack hammer attachment. The area was then hand excavated to approximately two feet by two feet horizontally and to approximately 12-inches bgs and the new protective cover and concrete pad was installed. The padlock and identification tag were reinstalled with the new protective cover. At G113, a skid-steer with a jack hammer attachment was utilized to remove the existing concrete surface pad. The area was then hand excavated to approximately two feet by two feet horizontally and to approximately 12-inches bgs and a new concrete pad was installed. **Attachment E** includes a photographic log of well pad installations and protective cover replacement.

Table B. Well Improvement and Repairs Summary - Bollards

Well Location	Number of Bollards Present Prior to June 2024	Number of Bollards Installed	Notes
A207	3	0	--
G104D	0	4	--
G104S	0	4	--
G109	0	4	--
G111	0	3	Three bollards installed in triangular shape.
G112	0	4	--
G113	0	3	Three bollards installed in triangular shape.
G115	0	4	--
G116	0	4	--
G118	3	0	Noted three pre-existing and stable bollards.
G125	3	3	Previous bollards in poor condition and replaced.
G130	1	4	One existing bollard removed prior to installation of four new bollards.
G202	2	2	Well shares bollards with R202. Four bollards surround well pair and provide adequate protection.
R219	1	0	Driller expressed safety concerns with working on slope at location.
T101	0	4	--
T102	0	4	--
Total Installed or Replaced		**47**	

Table C. Well Improvement and Repairs Summary – Pads and Protective Casings

Well Location	Protective Casing Replaced	Well Pad Replaced	Notes
G119	No	No	Noted during field visit that pad was sturdy and in good condition.
G125	No	No	Noted during field visit that pad was sturdy and in good condition.
G128	No	No	Unable to replace pad without damaging well, as annular spacing in protective casing was filled with concrete.
G139	No	No	Concrete added to well pad to increase stability and improve surface seal.
G202	No	No	Noted during field visit that pad was sturdy and in good condition.
G203	No	No	Unable to replace pad without damaging well, as annular spacing in protective casing was filled with concrete.
MW31S	No	No	Noted during field visit that pad was sturdy and in good condition.
A207	Yes	Yes	Added to scope, pad noted as in poor condition. Well pad and protective casing replaced.

Facility ID	St. Plane 823,040 ft. N, 1,001,281 ft. E. Ⓔ/W	Date Well Installed: 06/19/2024
Type of Well: Well Code 11/mw	Section Location of Waste/Source: ____ 1/4 of ____ 1/4 of Sec. ____, T. ____ N, R. ____ ☐ E ☐ W	Well Installed By: (Person's Name and Firm): Gavin Morgan
Distance from Waste/Source ft. / State: IL	Location of Well Relative to Waste/Source: u ☐ Upgradient s ☐ Sidegradient d ☐ Downgradient n ☐ Not Known	Gov. Lot Number: ____ Cascade Drilling LP

A. Protective pipe, top elevation 519.81 ft. (NAVD88)

B. Well casing, top elevation 519.53 ft. (NAVD88)

C. Land surface elevation 515.79 ft. (NAVD88)

D. Surface seal, bottom 514.8 ft. (NAVD88) or 1.0 ft.

12. USCS classification of soil near screen:
GP ☐ GM ☐ GC ☐ GW ☐ SW ☐ SP ☐
SM ☐ SC ☐ ML ☒ MH ☐ CL ☒ CH ☐
Bedrock ☐

13. Sieve analysis attached? ☐ Yes ☒ No

14. Drilling method used: Rotary ☐ Hollow Stem Auger ☐ Sonic Other ☒

15. Drilling fluid used: Water ☐ 0 2 Air ☐ Drilling Mud ☐ 0 3 None ☒

16. Drilling additives used? ☐ Yes ☒ No

Describe ____

17. Source of water (attach analysis, if required):

E. Bentonite seal, top 513.8 ft. (NAVD88) or 2.0 ft.

F. Fine sand, top ____ ft. (NAVD88) or ____ ft.

G. Filter pack, top 509.8 ft. (NAVD88) or 6.0 ft.

H. Screen joint, top 507.8 ft. (NAVD88) or 8.0 ft.

I. Well bottom 497.8 ft. (NAVD88) or 18.0 ft.

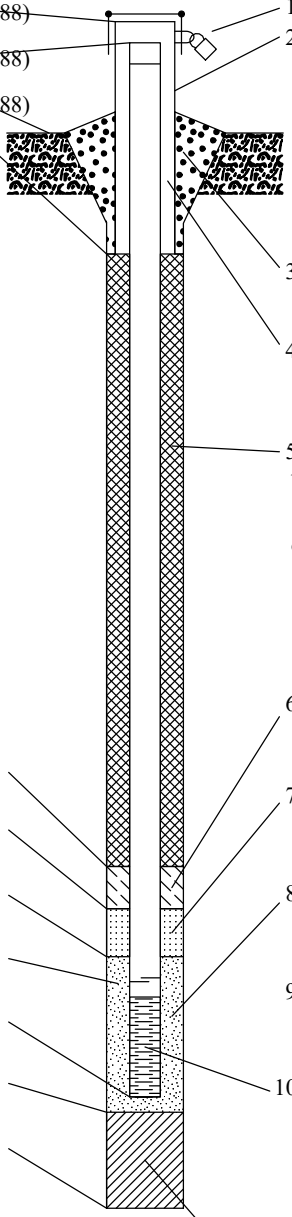
J. Filter pack, bottom 497.8 ft. (NAVD88) or 18.0 ft.

K. Borehole, bottom 497.8 ft. (NAVD88) or 18.0 ft.

L. Borehole, diameter 6.0 in.

M. O.D. well casing 2.38 in.

N. I.D. well casing 2.07 in.



1. Cap and lock? ☒ Yes ☐ No
2. Protective cover pipe:
   a. Inside diameter: 4.0 in.
   b. Length: 5.0 ft.
   c. Material: Steel ☒ Other ☐
   d. Additional protection? ☒ Yes ☐ No
   If yes, describe: 4 steel bollards
3. Surface seal: Bentonite ☐ Concrete ☒ Other ☐
4. Material between well casing and protective pipe: Bentonite ☒ Sand Other ☒
5. Annular space seal: a. Granular/Chipped Bentonite ☒
   b. ____ Lbs/gal mud weight . . . Bentonite-sand slurry ☐
   c. ____ Lbs/gal mud weight . . . Bentonite slurry ☐
   d. ____ % Bentonite . . . Bentonite-cement grout ☐
   e. 0.5 Ft^3 volume added for any of the above
   f. How installed: Tremie ☐ Tremie pumped ☐ Gravity ☒
6. Bentonite seal: a. Bentonite granules ☐
   b. ☐ 1/4 in. ☒ 3/8 in. ☐ 1/2 in. Bentonite chips ☒
   c. ____ Other ☐
7. Fine sand material: Manufacturer, product name & mesh size
   a. ____
   b. Volume added ____ ft^3
8. Filter pack material: Manufacturer, product name & mesh size
   a. K&E Well Gravel
   b. Volume added 2 ft^3
9. Well casing: Flush threaded PVC schedule 40 ☒ Flush threaded PVC schedule 80 ☐ Other ☐
10. Screen material: Schedule 40 PVC
    a. Screen Type: Factory cut ☒ Continuous slot ☐ Other ☐
    b. Manufacturer Johnson Screens
    c. Slot size: 0.010 in.
    d. Slotted length: 10.0 ft.
11. Backfill material (below filter pack): None ☒ Other ☐

MONITORING WELL DEVELOPMENT LOGS

MONITORING WELL DEVELOPMENT

Facility/Project Name	State	Well Name
Vistra - Newton Nature and Extent	Illinois	APW19S

Facility License, Permit or Monitoring Number

1. Can this well be purged dry? ☑ Yes ☐ No

2. Well development method:
- surged with bailer and bailed ☐
- surged with bailer and pumped ☐
- surged with block and bailed ☐
- surged with block and pumped ☑
- surged with block, bailed, and pumped ☐
- compressed air ☐
- bailed only ☐
- pumped only ☐
- pumped slowly ☐
- other _____ ☐

3. Time spent developing well 53 min.

4. Depth of well (from top of well casing) 20.29 ft.

5. Inside diameter of well 2.0 in.

6. Volume of water in filter pack and well casing 6.89 gal.

7. Volume of water removed from well ~ 40 gal.

8. Volume of water added (if any) ~ 125 gal.

9. Source of water added On-site potable

10. Analysis performed on water added? ☐ Yes ☑ No
(If yes, attach results)

		Before Development	After Development
11. Depth to Water (from top of well casing)	a.	7.29 ft.	20.29 ft.
Date	b.	6/27/2024	6/27/2024
Time	c.	8:35 ☑ a.m. ☐ p.m.	12:40 ☐ a.m. ☑ p.m.
12. Sediment in well bottom		0.02 inches	0.01 inches
13. Water clarity		Clear ☐ Turbid ☑ (Describe) light brown	Clear ☐ Turbid ☑ (Describe) slightly cloudy brown

Fill in if drilling fluids were used and well is at solid waste facility:

14. Total suspended solids	mg/l	mg/l
15. COD	mg/l	mg/l

16. Well developed by: Person's Name and Firm
Lauren Anderson
Ramboll Americas Engineering Solutions, Inc.

17. Additional comments on development:

08:35-09:05 - purged dry ~ 3 times
12:17-12:40 - purged dry ~ 3 times

RE: NEW-23Q3 **WorkOrder:** 23070389

Dear Eric Bauer:

TEKLAB, INC received 24 samples for NEW-SUP-000 on 8/17/2023 2:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Elizabeth A. Hurley

Elizabeth A. Hurley
Director of Customer Service

Report Contents

Client: Ramboll
Work Order: 23070389
Client Project: NEW-23Q3
Report Date: 13-Nov-23

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	7
Laboratory Results	8
Sample Summary	56
Dates Report	57
Quality Control Results	87
Receiving Check List	194
Chain of Custody	Appended

Client: Ramboll **Work Order:** 23070389

Client Project: NEW-23Q3 **Report Date:** 13-Nov-23

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: Ramboll **Work Order:** 23070389

Client Project: NEW-23Q3 **Report Date:** 13-Nov-23

Qualifiers

# -	Unknown hydrocarbon	B -	Analyte detected in associated Method Blank
C -	RL shown is a Client Requested Quantitation Limit	E -	Value above quantitation range
H -	Holding times exceeded	I -	Associated internal standard was outside method criteria
J -	Analyte detected below quantitation limits	M -	Manual Integration used to determine area response
ND -	Not Detected at the Reporting Limit	R -	RPD outside accepted recovery limits
S -	Spike Recovery outside recovery limits	T -	TIC(Tentatively identified compound)
X -	Value exceeds Maximum Contaminant Level		

Client: Ramboll
Work Order: 23070389
Client Project: NEW-23Q3
Report Date: 13-Nov-23

Cooler Receipt Temp: 3.8 °C

An employee of Teklab, Inc. collected the sample(s).

Lab conductivity will be reported for APW02, APW03, APW04, APW05S, APW07, APW08, APW09, APW10, APW13, APW14, APW17, G104, G106, G118, G139, G141, G201, G208, G217S, G221, G225, R217D, R219 and applicable field duplicates due to field meter malfunction(s). JC/EAH 8/2/23

A215, G06D, G105, G202, G230, and MW46D could not be collected; the wells were dry. G108 could not be collected; the well was abandoned. L301 could not be collected; the well was inoperable. EAH 8/2/23

Depth, only, wells will be reported with collection dates/times per the field file. G118 will be reported as collected at 0726 per the field file. EAH 8/4/23

Per Eric Bauer, include total Iron for G201, G223, and G224 and include total and dissolved Iron for G231, G232, and G233. (ehurley - 8/10/2023 7:54:42 AM)

G104D and G223 collection times will be reported per the field file(s) rather than the chain of custody forms. EAH 8/16/23

A214, G116, G231, G232, MW35D, and APW02 (and its field duplicate) required resampling due to field meter errors. The resamples will be included in the final report(s). MW35D was dry at resampling. EAH 8/18/23

Per Eric Bauer's request, only NEW-SUP-000 data is included in this report. EAH 11/13/23

Mn was detected in the MBLK at a level above the MDL and the RL. Sample result showed a low level of Mn. Sample results may be biased high by detectable levels in the MBLK. Sample is consumed.

CCV recovered outside the upper control limits for TL. Sample results are below the reporting limit. Data is reportable per the TNI standard.

Client: Ramboll
Client Project: NEW-23Q3

Work Order: 23070389
Report Date: 13-Nov-23

Carrier: Skylar Mathis
Received By: ANC

Completed by: Amber Dilallo
On: 02-Aug-23

Reviewed by: Ellie Hopkins
On: 02-Aug-23

Pages to follow: Chain of custody 26 Extra pages included 0

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C 3.8
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice ☐
Chain of custody present?	Yes ☑	No ☐		
Chain of custody signed when relinquished and received?	Yes ☑	No ☐		
Chain of custody agrees with sample labels?	Yes ☑	No ☐		
Samples in proper container/bottle?	Yes ☑	No ☐		
Sample containers intact?	Yes ☑	No ☐		
Sufficient sample volume for indicated test?	Yes ☑	No ☐		
All samples received within holding time?	Yes ☑	No ☐		
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐		

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☐	No ☐	No VOA vials ☑
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

pH strip #90719/79929. - TWM/CET/acolin - 7/25/2023 10:12:23 AM
Additional HNO3 (90404) was needed in XPWO1 upon arrival at the laboratory. - acolin - 7/25/2023 10:12:26 AM
Additional HNO3 (90404) was needed in APWO2, G232 upon arrival at the laboratory. - acolin - 7/26/2023 1:35:53 PM
Additional HNO3 (90404) was needed in G225, additional H2SO4 (90128) was needed in G225, and additional NaOH (81662) was needed in G217S, G225, R2170, A213DUP upon arrival at the laboratory. - acolin - 7/27/2023 9:04:36 AM
Samples collected on 7/26/23 were delivered to the laboratory on 7/26/23 at 1805 (on ice - 8.4C - LTG#5). pH strip #90719/79929 - ANC/ERH 7/27/23
G141 was filtered and preserved with nitric acid (90404) for the dissolved parameters upon arrival at the laboratory. - TM/ehopkins - 7/27/2023 9:36:45 AM
L1R was preserved with HNO3 (90404) upon arrival at the laboratory. Sample did not reach the desired pH range. G104, G106, G1139, R219, G104DUP were preserved with NaOH (81662) upon arrival at the laboratory. - MP/acolin - 7/28/2023 9:50:16 AM
Samples collected on 7/31/23 were delivered to the laboratory on 8/01/23 at 805 (on ice - 5.8C - LTG#1). pH strip #90719 - CET/ERH 7/27/23
Samples collected on 8/01/23 were delivered to the laboratory on 8/02/23 at 1000 (on ice - 3.4C - LTG#1). pH strip #90719 - CET/ERH 7/27/23
Samples collected on 8/16/23 were delivered to the laboratory on 8/16/23 at 1529 (on ice - 5.4C - LTG#5). pH strip #90719/79929 - CET/ERH 7/27/23
pH strip #90719. - amberdilallo - 8/17/2023 3:34:30 PM
Samples collected on 8/17/23 were delivered to the laboratory on 8/17/23 at 1400 (on ice - 1.2C - LTG#1). pH strip #90719/79929 - AMD/ERH 8/17/23

RE: NEW-24Q2 **WorkOrder:** 24031341

Dear Eric Bauer:

TEKLAB, INC received 7 samples for NEW_SUP_000 on 4/10/2024 3:16:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report,Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Elizabeth A. Hurley

Elizabeth A. Hurley
Director of Customer Service

Report Contents

Client: Ramboll
Client Project: NEW-24Q2

Work Order: 24031341
Report Date: 14-May-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Sample Summary	14
Quality Control Results	15
Receiving Check List	50
Chain of Custody	Appended

Client: Ramboll **Work Order:** 24031341

Client Project: NEW-24Q2 **Report Date:** 14-May-24

Abbr Definition

*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: Ramboll **Work Order:** 24031341

Client Project: NEW-24Q2 **Report Date:** 14-May-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐	Temp °C	14.1
Type of thermal preservation?	None ☐	Ice ☑	Blue Ice ☐	Dry Ice	☐
Chain of custody present?	Yes ☑	No ☐			
Chain of custody signed when relinquished and received?	Yes ☑	No ☐			
Chain of custody agrees with sample labels?	Yes ☑	No ☐			
Samples in proper container/bottle?	Yes ☑	No ☐			
Sample containers intact?	Yes ☑	No ☐			
Sufficient sample volume for indicated test?	Yes ☑	No ☐			
All samples received within holding time?	Yes ☑	No ☐			
Reported field parameters measured:	Field ☑	Lab ☐	NA ☐		
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐			

When thermal preservation is required, samples are compliant with a temperature between 0.1°C - 6.0°C, or when samples are received on ice the same day as collected.

Water – at least one vial per sample has zero headspace?	Yes ☑	No ☐	No VOA vials ☐
Water - TOX containers have zero headspace?	Yes ☐	No ☐	No TOX containers ☑
Water - pH acceptable upon receipt?	Yes ☐	No ☑	NA ☐
NPDES/CWA TCN interferences checked/treated in the field?	Yes ☐	No ☐	NA ☑

Any No responses must be detailed below or on the COC.

Preservation checks for O&G analysis are to be completed by the laboratory technician prior to analysis. - pschultz - 4/3/2024 9:59:21 AM

pH strip #96651/89660. - pschultz - 4/3/2024 9:59:25 AM

Additional Nitric Acid (96331) and Sulfuric Acid (94915) were needed upon arrival at the laboratory. - pschultz - 4/3/2024 9:59:42 AM

G232 was filtered for the dissolved parameters upon arrival at the laboratory. - pschultz - 4/3/2024 10:00:12 AM

Samples were received on 4/3/24 at 17:39 on ice [1.6C - LTG#7]. - pschultz - 4/4/2024 12:05:39 PM

Additional Sodium Hydroxide (95443) and Sulfuric Acid (94915) were needed upon arrival at the laboratory. - pschultz - 4/4/2024 12:07:21 PM

pH strip #96651/89660. - pschultz - 4/4/2024 12:08:05 PM

Samples were received on 4/5/2024 at 11:04 on ice [0.5C - LTG#7]. NR - pschultz - 4/5/2024 11:59:34 AM

Additional Nitric Acid (96869) was needed upon arrival at the laboratory. NR - pschultz - 4/5/2024 12:01:15 PM

pH strip #96651. NR - pschultz - 4/5/2024 12:01:28 PM

Samples were received on 4/8/24 at 1725 on ice [4.8C - LTG7]. pH strip #89660/96651. Preservation checks for O&G analysis are to be completed by the laboratory technician prior to analysis. Additional Sulfuric Acid (94915), Nitric Acid (96869) and Sodium Hydroxide (95443) were

RE: NEW-24Q3 **WorkOrder:** 24061026

Dear Eric Bauer:

TEKLAB, INC received 20 samples for NEW_NE_501 on 8/8/2024 2:24:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report,Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Elizabeth A. Hurley
Director of Customer Service
(618)344-1004 ex 33

Report Contents

Client: Ramboll
Work Order: 24061026
Client Project: NEW-24Q3
Report Date: 06-Sep-24

This reporting package includes the following:

Cover Letter	1
Report Contents	2
Definitions	3
Case Narrative	5
Accreditations	6
Laboratory Results	7
Sample Summary	33
Quality Control Results	34
Receiving Check List	146
Chain of Custody	Appended

Client: Ramboll **Work Order:** 24061026

Client Project: NEW-24Q3 **Report Date:** 06-Sep-24

Abbr Definition

Abbr	Definition
*	Analytes on report marked with an asterisk are not NELAP accredited
CCV	Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration.
CRQL	A Client Requested Quantitation Limit is a reporting limit that varies according to customer request. The CRQL may not be less than the MDL.
DF	Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilution factors.
DNI	Did not ignite
DUP	Laboratory duplicate is a replicate aliquot prepared under the same laboratory conditions and independently analyzed to obtain a measure of precision.
ICV	Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated.
IDPH	IL Dept. of Public Health
LCS	Laboratory control sample is a sample matrix, free from the analytes of interest,spiked with verified known amounts of analytes and analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system.
LCSD	Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MBLK	Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses.
MDL	"The method detection limit is defined as the minimum measured concentration of a substance that can be reported with 99% confidence that the measured concentration is distinguishable from method blank results."
MS	Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request).
MSD	Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request).
MW	Molecular weight
NC	Data is not acceptable for compliance purposes
ND	Not Detected at the Reporting Limit
NELAP	NELAP Accredited
PQL	Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions.
RL	The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL.
RPD	Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request).
SPK	The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes.
Surr	Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples.
TIC	Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET"
TNTC	Too numerous to count (> 200 CFU)

Client: Ramboll **Work Order:** 24061026

Client Project: NEW-24Q3 **Report Date:** 06-Sep-24

Qualifiers

- # - Unknown hydrocarbon
- B - Analyte detected in associated Method Blank
- C - RL shown is a Client Requested Quantitation Limit
- E - Value above quantitation range
- H - Holding times exceeded
- I - Associated internal standard was outside method criteria
- J - Analyte detected below quantitation limits
- M - Manual Integration used to determine area response
- ND - Not Detected at the Reporting Limit
- R - RPD outside accepted recovery limits
- S - Spike Recovery outside recovery limits
- T - TIC(Tentatively identified compound)
- X - Value exceeds Maximum Contaminant Level

Case Narrative

Section A Required Client Information:

Company:	Vistra Corp-Newton
Address:	6725 N 500th St
	Newton, IL 62448
Email To:	Brian.Voelker@VistraCorp.com
Phone: (217) 753-8911	Fax:
Requested Due Date/TAT:	10 day

Section B Required Project Information:

Report To:	Brian Voelker
Copy To:	Terry Hanratty - Terry.Hanratty@vistracorp.com
	Sam Davies - samantha.davies@vistracorp.com
Purchase Order No.:	
Project Name:	
Project Number:	

Section C Invoice Information:

Attention:	Terry Hanratty
Company Name:	Vistra Corp
Address:	see Section A
Quote Reference:	
Project Manager:	
Profile #:	

REGULATORY AGENCY

NPDES GROUND WATER DRINKING WATER

UST RCRA OTHER

Site Location STATE: IL

Section D Required Client Information

SAMPLE ID
(A-Z, 0-9 / ,-)
Sample IDs MUST BE UNIQUE

Valid Matrix Codes

MATRIX	CODE
DRINKING WATER	DW
WATER	WT
WASTE WATER	WW
PRODUCT	P
SOIL/SOLID	SL
OIL	OL
WIPE	WP
AIR	AR
OTHER	OT
TISSUE	TS

Requested Analysis Filtered (Y/N)

Resampling + new wells.
